**This report was supported by Grant/Cooperative Agreement Number U17/CCU424766-01 from the Centers for Disease Control and Prevention (CDC). Its contents are solely the responsibility of the Florida Department of Health and do not necessarily represent the official views of the Centers for Disease Control and Prevention.**

## Message from the State Surgeon General

Injury is the leading cause of death of Florida residents ages 1-44 every year. Overall, injury was the 3<sup>rd</sup> leading cause of death of Florida residents in 2005, after heart disease and cancer. Most, if not all, of these injuries are preventable.

With the formal establishment of the Office of Injury Prevention within the Department of Health in 2003, the State of Florida renewed its commitment to reduce the needless burden of preventable injuries to its residents and visitors. Since then, by collaborating with its public and private partners, the Office of Injury Prevention has achieved several major milestones in its mission, including the development of the 2004-2008 Florida Injury Prevention Strategic Plan, and the formation of the Florida Injury Prevention Advisory Council and Goal Teams to implement the strategic plan. In August 2005, Florida was one of 30 states awarded a five year Public Health Injury Surveillance and Prevention Program cooperative agreement grant from the Centers for Disease Control and Prevention that provides financial support for implementing this strategic plan.

The Office of Injury Prevention is pleased to present the 2007 Florida Injury Data Report. This report reflects the culmination of grant activities in the second year of the cooperative agreement, and also fulfills an objective of Goal 6 in the 2004-2008 Florida Injury Prevention Strategic Plan, to increase the quality and availability of statewide and community-specific injury data for planning, surveillance, and evaluation. We hope that residents and injury prevention stakeholders throughout the state will use the information in this report to promote, protect, and improve the health and safety of all people in Florida by reducing the burden of injuries in their communities.

Sincerely,

A handwritten signature in cursive script that reads "Ana M. Viamonte Ros". The ink is dark and the signature is written in a fluid, personal style.

Ana M. Viamonte Ros, M.D., M.P.H  
State Surgeon General

## Executive Summary

This report was produced as part of the Public Health Injury Surveillance and Prevention Program cooperative agreement between the Centers for Disease Control and Prevention (CDC) and the Florida Department of Health, Office of Injury Prevention. This report also fulfills an objective of the 2006-2007 Action Plan of the 2004-2008 Florida Injury Prevention Strategic Plan to produce an injury surveillance data report for distribution to Florida's residents and injury prevention stakeholders.

For this report, deaths and hospitalizations of Florida residents in 2005 were analyzed for all injuries, unintentional injuries, suicides and suicide attempts/self-inflicted injuries, homicides and assault injuries, unintentional drownings and non-fatal near drownings, unintentional falls, unintentional fires, firearm injuries, motor vehicle related injuries (including injuries to motor vehicle occupants, motorcyclists, pedal cyclists, and pedestrians), poisonings, traumatic brain injuries, and hip fractures among residents aged 65 years and older. The statewide demographics of each injury (sex, race/Hispanic ethnicity, and age-specific rates) are presented, as well as other characteristics unique to each injury. Data is also presented in charts and graphs for easier understanding.

In additions, age-specific death and hospitalization numbers and rates for each injury are given for residents of each of Florida's 67 counties to inform residents and stakeholders at the local level. Except for age-specific rates, all rates have been age-adjusted to the 2000 U.S. standard population for comparability between counties, and between counties and the state.

An interpretation of the data is provided for each injury, and examples of what Florida is doing to reduce the incidence of each injury are given. These examples are not intended to be exhaustive. The Office of Injury Prevention conducted a separate inventory of injury prevention resources in the state as another part of the cooperative agreement with CDC.

The report concludes with appendices that describe the data sources used for this report and case definitions for each injury. Resident population estimates and demographics, a discussion of calculating age-adjusted rates, and contact information are also included.

## 2005 Data Summary

DEATHS	Florida Count	Florida Rate	US Rate	Florida Male Count	Florida Male Rate	Florida Female Count	Florida Female Rate
<b>Injuries by Intent</b>							
All Injuries	12,199	64.5	57.6	8,499	94.4	3,699	35.8
Unintentional Injuries	8,743	45.6	38.9	5,878	65.2	2,864	26.9
Suicides	2,308	12.2	10.8	1,750	19.1	558	5.8
Homicides	988	5.8	6.1	769	9.0	219	2.5
<b>Injuries by Mechanism</b>							
Unintentional Drownings	382	2.1	N/A	309	3.5	73	0.8

Pedal Cyclists	555	3.1	N/A	461	5.2	93	1.1
Pedestrians	1,752	9.8	N/A	1,155	13.3	595	6.2
Poisonings	13,737	77.5	N/A	6,200	71.1	7,537	83.7
<b>Injuries by Type</b>							
Traumatic Brain Injuries	16,859	87.1	N/A	10,661	118.0	6,194	56.5
Hip Fractures, Ages 65+	19,000	143.7	N/A	5,204	98.6	13,796	176.7

Rates based on <20 cases may be unstable. Hospitalizations based on 85.2% valid E-coding rate. U.S. death rates from CDC WISQUARS <<http://www.cdc.gov/ncipc/wisquars/>>. Some U.S. death rates not available due to WISQUARS query limitations. U.S. hospitalization rates not available. All rates are age-adjusted per 100,000.

## All Injuries

Injury is defined as an “acute exposure to physical agents such as mechanical energy, heat, electricity, chemicals, and ionizing radiation in amounts or at rates above or below the threshold of human tolerance” that damages the body.<sup>1</sup>

An injury can be described by its mechanism and intent. Mechanism refers to the external cause of injury, such as drowning, fall, fire, firearm, motor vehicle traffic crash, poisoning, or suffocation. Intent refers to the motivation of the injury perpetrator behind the cause of injury, and is classified as unintentional (accidental), self-inflicted (suicides and suicide attempts), assaults (homicides), or undetermined. Injury mechanisms can be of any intent. An injury can also be described by the physical nature (type) of injury and the body region injured, as for example, a hip fracture.<sup>1</sup> In 2005:

- There were 12,199 deaths and 116,968 hospitalizations due to injuries of all mechanisms and intents of Florida residents.
- Males made up 70% of all injury deaths and females made up 30%, whereas females made up 51% of all injury hospitalizations and males made up 49%.
- Whites made up nearly three-quarters of all injury deaths and hospitalizations, Hispanics 13%, while Blacks made up 10% of all injury hospitalizations and 12% of all injury deaths.
- Unintentional injuries made up 72% of all injury deaths, suicides 19%, and homicides 8%.
- Unintentional injuries made up 72% of all injury hospitalizations, suicide attempts 7%, and assaults 4%.
- The leading mechanisms of injury deaths were motor vehicle accidents (28%), poisonings (20%), firearms (15%), falls (14%), suffocation (8%), and drownings (4%).
- The leading mechanisms of injury for injury hospitalizations were falls (40%), motor vehicle accidents (15%), poisonings (12%), struck by/against (3%), and cut/pierce (3%).

## What is Florida Doing to Reduce Injuries?

- Established by Florida Statute 401.243 in 2004, the Florida Department of Health, Office of Injury Prevention's mission is "to provide leadership to public and private partners dedicated to reducing Florida's injury burden."
- The 2004-2008 Florida Injury Prevention Strategic Plan was developed to carry out this mission by meeting 8 goals that address infrastructure, funding, community capacity, training, interventions, data, evaluation, and advocacy.
- Representing key stakeholder constituencies in Florida's injury prevention workforce, the Florida Injury Prevention Advisory Council and Goal Teams were established to implement the 2004-2008 Florida Injury Prevention Strategic Plan.
- Florida is one of 30 states funded by the Centers for Disease Control and Prevention's Public Health Injury Surveillance and Prevention Program to implement the 2004-2008 Florida Injury Prevention Strategic Plan.

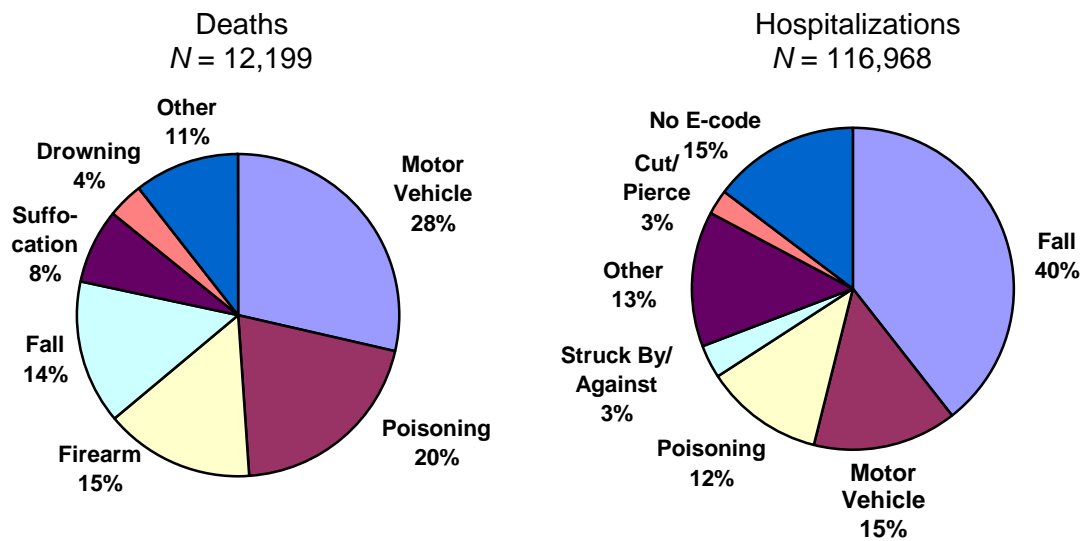

Figure 5. Age-Specific All Injury Death Rates by Sex and Age Group

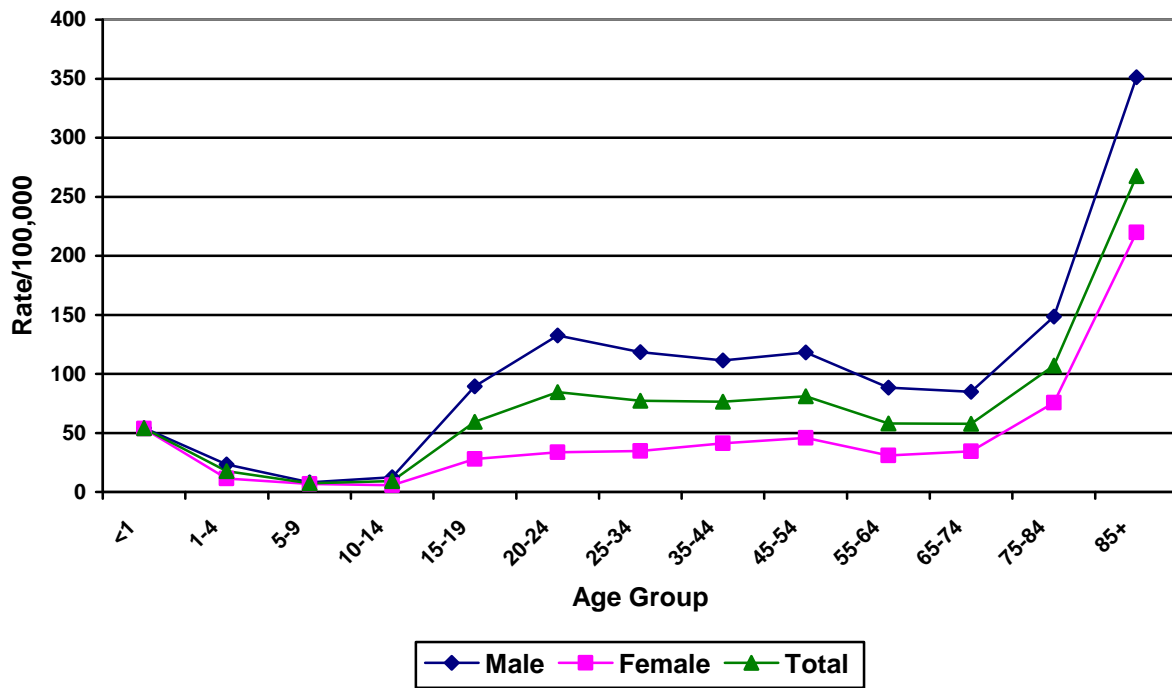

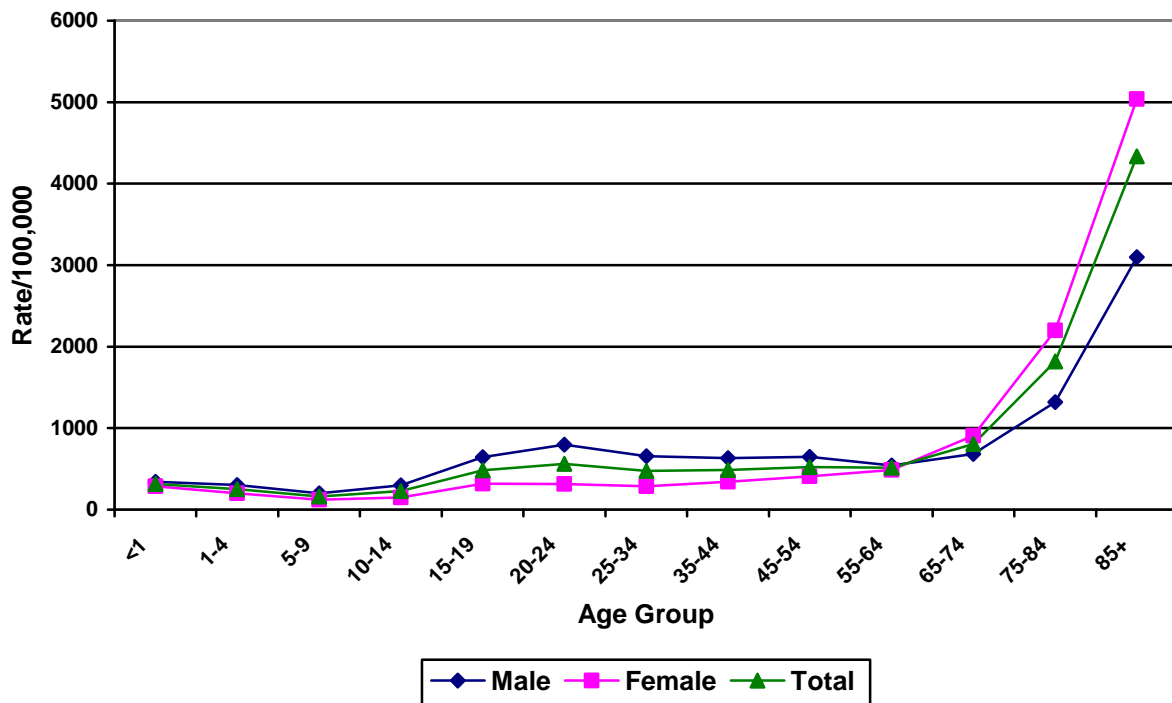

Figure 6. Age-Specific All Injury Hospitalization Rates by Sex and Age Group

## Unintentional Injuries

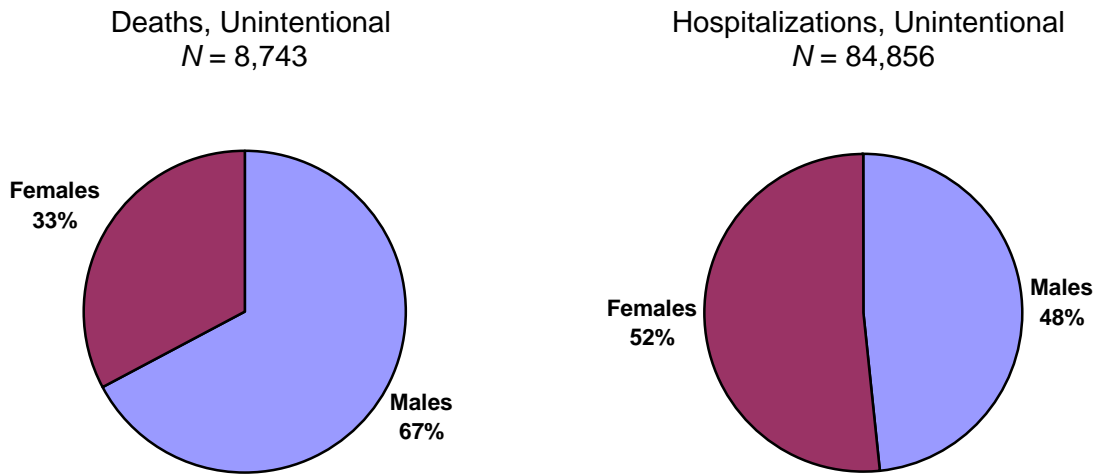

Unintentional injuries, also called “accidental injuries,” result from a variety of mechanisms of injury – drownings, falls, fires, motor vehicle crashes, etc. – that were not intentionally caused by someone. Injury prevention advocates prefer using the term “unintentional injuries” rather than “accidental injuries” because many, if not all, of these injuries are preventable. In 2005:

- There were 8,743 deaths and 84,856 hospitalizations due to unintentional injuries of Florida residents.
- Males made up 67% of unintentional injury deaths and females made up 33%, whereas females made up 52% of unintentional injury hospitalizations and males made up 48%.
- Whites made up about three-quarters of unintentional injury deaths and hospitalizations. Hispanics made up 14% of unintentional injury deaths and 13% of unintentional injury hospitalizations. Blacks made up 10% of unintentional injury deaths and 9% of unintentional injury hospitalizations.
- The top three mechanisms of injury for unintentional injury deaths were motor vehicle accidents (40%), poisonings (22%), and falls (19%). The top three mechanisms of injury for unintentional injury hospitalizations were falls (55%), motor vehicle accidents (20%), and poisonings (5%).
- Florida residents ages 75 and over had the highest rates of unintentional injury deaths and hospitalizations. After age 65, the unintentional injury hospitalization rate for females surpasses the rate for males.

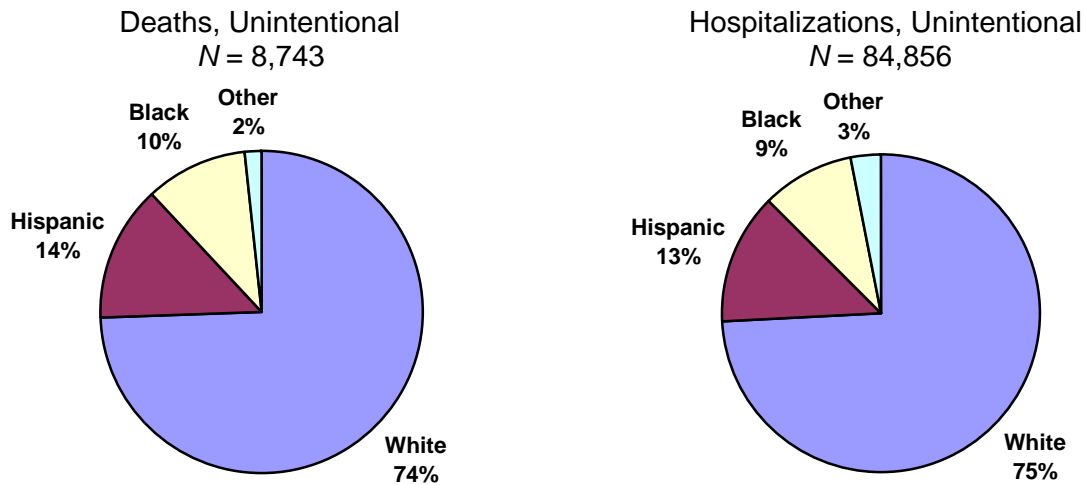

### What is Florida Doing to Reduce Unintentional Injuries?

- Florida has 15 local Safe Kids coalitions and chapters dedicated to the prevention of accidental injuries in children ages 14 and under in the following counties: Alachua, Bradford, Brevard, Broward, Columbia, Dixie, Duval, Flagler, Gilchrist, Hillsborough, Lee, Leon, Levy, Manatee, Marion, Miami-Dade, Orange, Osceola, Palm Beach, Pasco, Pinellas, Polk, St. Johns, Sarasota, Seminole, Suwannee, Union, and Volusia. The Florida Department of Health, Office of Injury Prevention is the lead agency for Safe Kids Florida.
- The Department of Elder Affairs and Communities for a Lifetime are working to provide seniors the opportunity to remain healthy and independent in their own communities. A focus is on increased safety through improved coordination of transportation, community planning, universal home designs, and neighborhood interaction.
- The Florida Association of Area Agencies on Aging meets on a regular basis to share data, plan advocacy activities and design coordinated aging programs. The eleven partner organizations work closely with the Florida Department of Elder Affairs to develop effective and efficient projects benefiting a large number of Florida's constituency of over three and a half million seniors.

**Figure 9. Unintentional Injury Deaths and Hospitalizations by Mechanism of Injury**

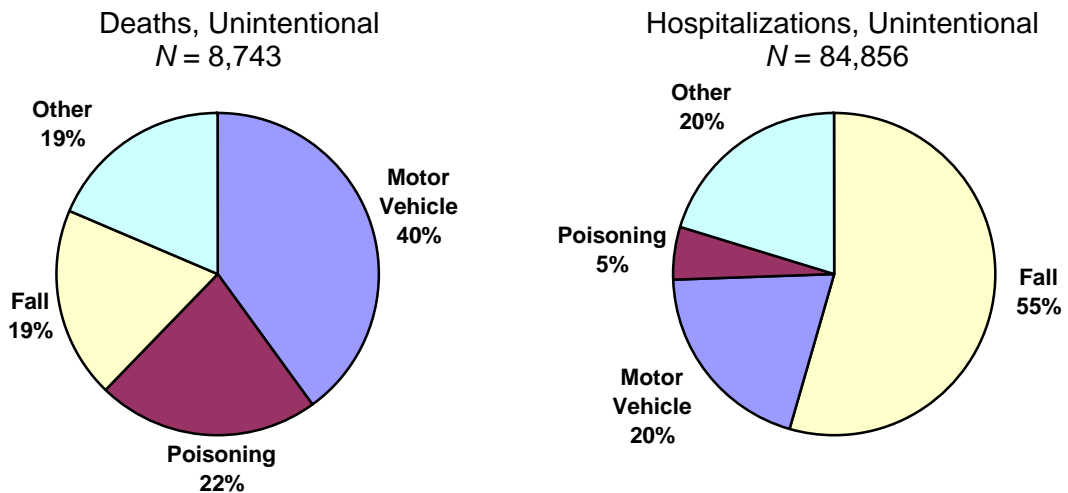

Figure 10. Age-Specific Unintentional Injury Death Rates by Sex and Age Group

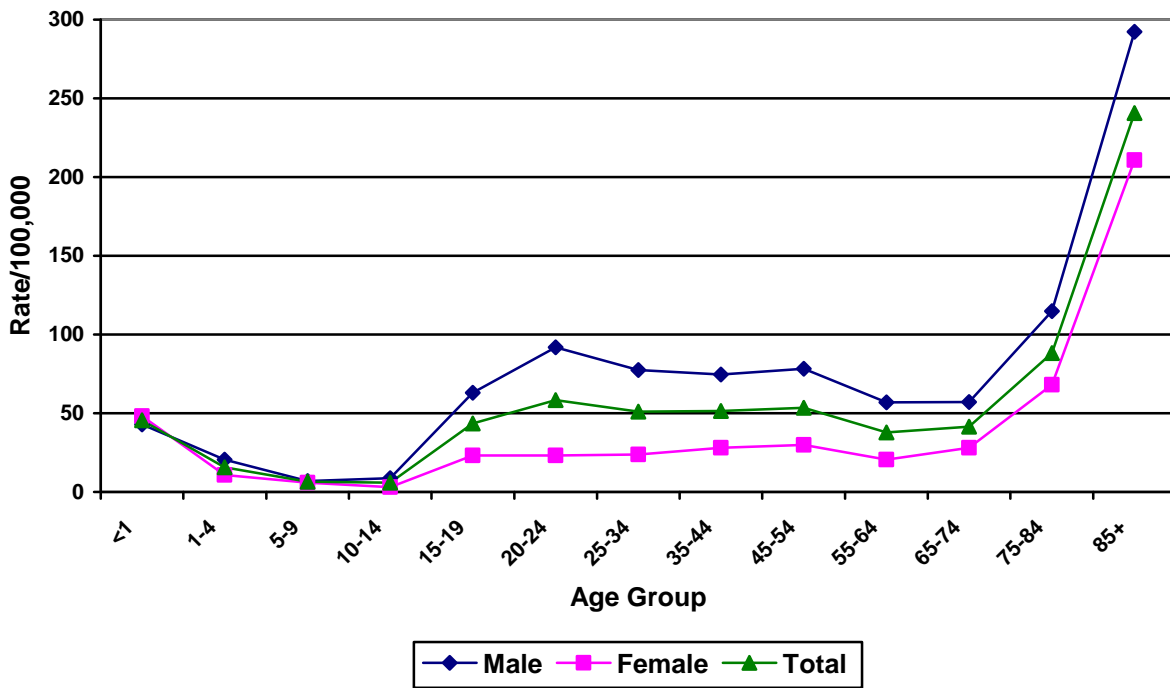

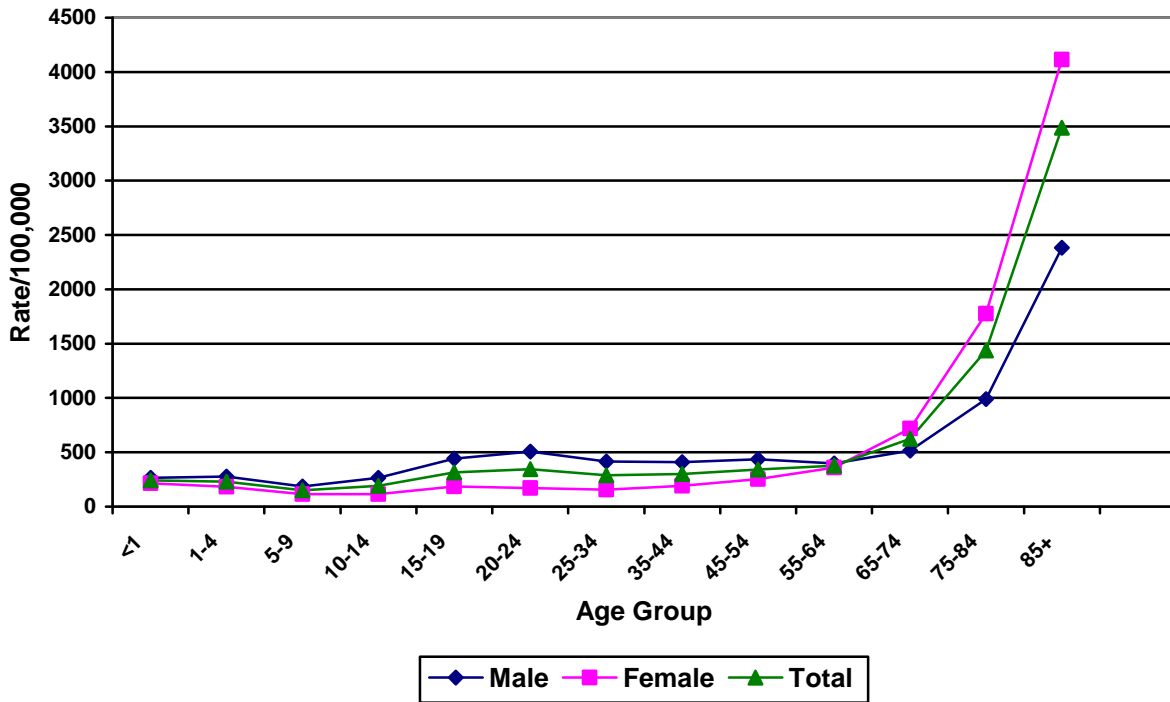

Figure 11. Age-Specific Unintentional Injury Hospitalization Rates by Sex and Age Group

## **Suicides and Suicide Attempts/Self-Inflicted Injuries**

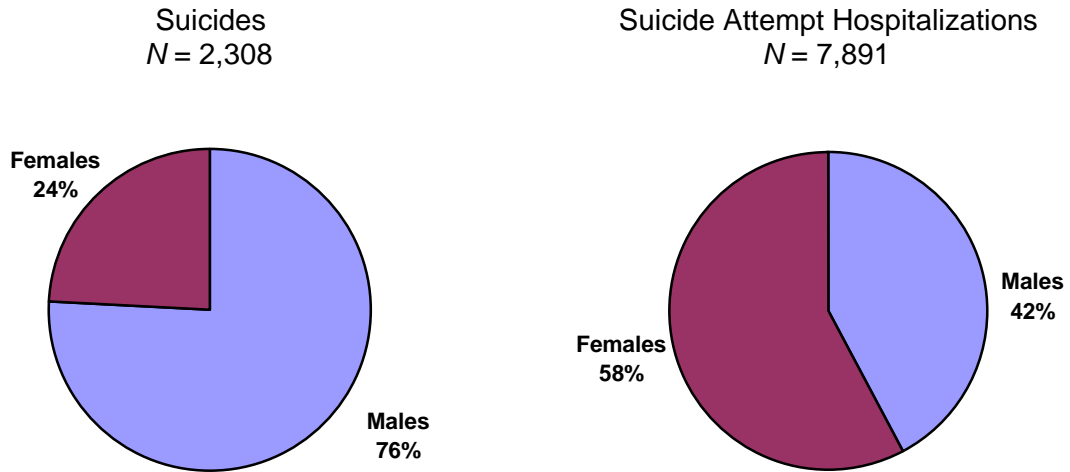

Suicides and suicide attempts refer to injuries that were purposefully (intentionally) self-inflicted. Firearms and poisonings are common mechanisms of injury for suicides and suicide attempts, although these can result from any mechanism. In 2005:

- There were 2,308 suicides and 7,891 hospitalizations for suicide attempts of Florida residents.
- Males made up 76% of suicides and females made up 24%, whereas females made up 58% of hospitalizations for suicide attempts and males made up 42%.
- Whites made up 84% of suicides, Hispanics 9%, and Blacks 5%. Whites made up 77% of hospitalizations for suicide attempts, Hispanics 12%, and Blacks 8%.
- The top three mechanisms of injury for suicides were firearms (50%), poisonings (20%), and suffocation (21%). The top three mechanisms of injury for hospitalized suicide attempts were poisonings (92%), cut/pierce (4%), and firearms (1%).
- Males aged 75 years and older had the highest rates of suicides, while females ages 15-19 had the highest rate of hospitalizations for suicide attempts.

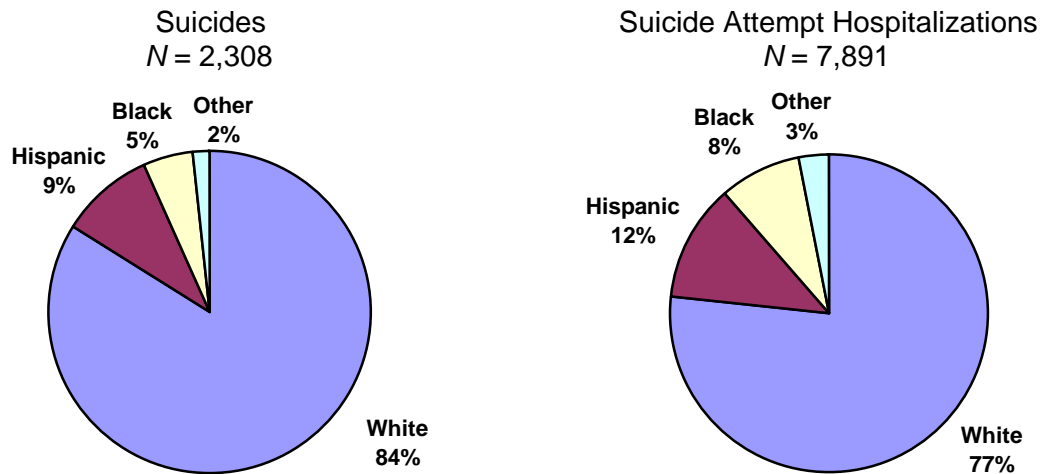

### **What is Florida Doing to Reduce Suicides and Suicide Attempts?**

- The Florida Office of Drug Control (ODC) in the Executive Office of the Governor is coordinating suicide prevention efforts in the state of Florida. In January 2005, ODC released the 2005-2010 Florida Suicide Prevention Strategy, a 5-year blueprint for reducing the incidence of suicide, teen suicide, and elder suicide by one-third by 2010.
- The Statewide Office of Suicide Prevention (OSP) as a unit of the Office of Drug Control was established in May 2007 by Florida Statute 14.2019. The OSP, in collaboration with the Suicide Prevention Coordinating Council, will develop and implement the Florida Suicide Prevention Strategy statewide and assist communities in carrying out local suicide prevention efforts.
- The Beth Foundation provides the Florida Youth Suicide Prevention Gatekeeper Training to recognize the warning signs of suicidal behavior in youth.

**Figure 14. Suicides and Suicide Attempt Hospitalizations by Mechanism of Injury**

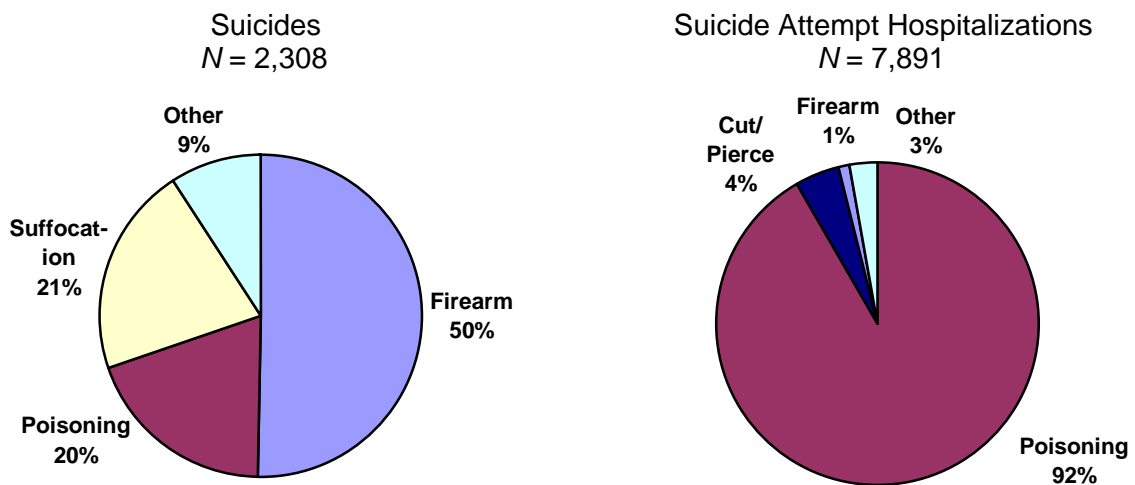

Figure 15. Age-Specific Suicide Rates by Sex and Age Group

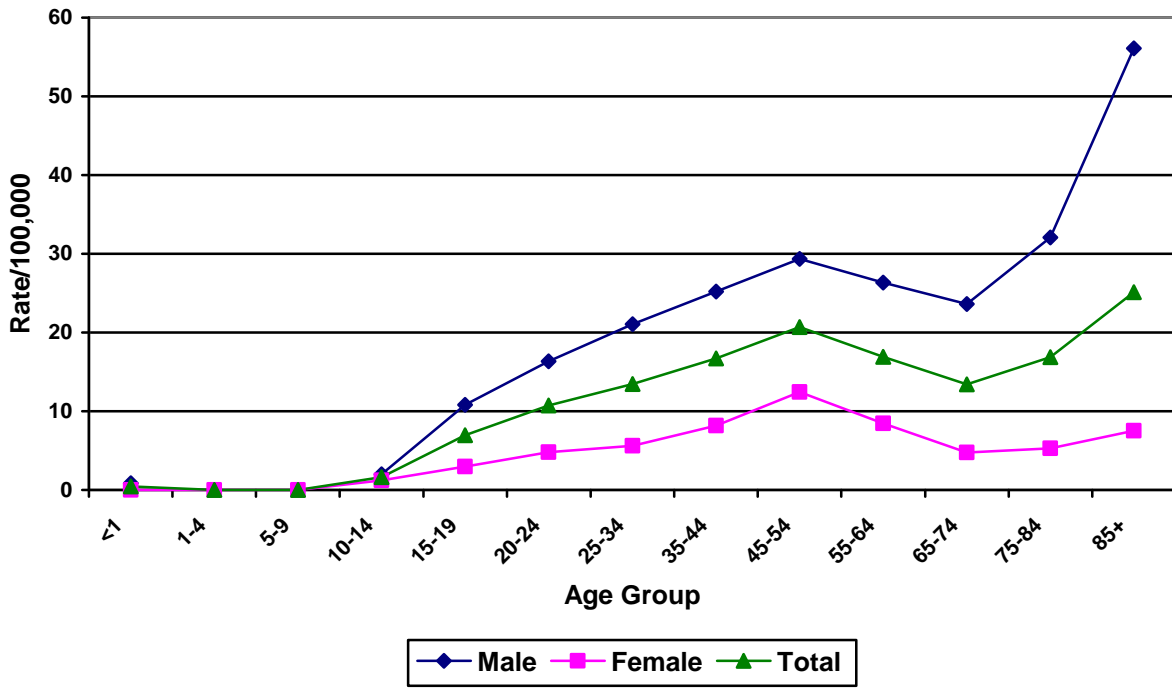

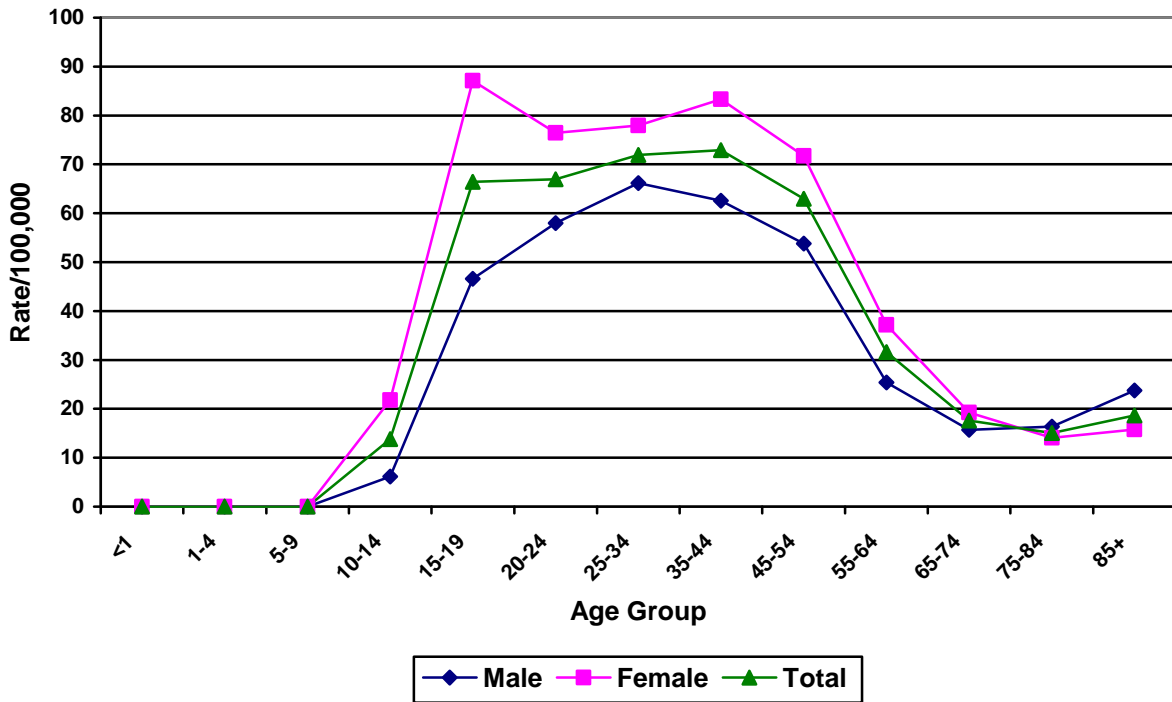

Figure 16. Age-Specific Suicide Attempt Hospitalization Rates by Sex and Age Group

## Homicides and Assault Injuries

Homicides and assault injuries result from intentionally injuring (assaulting) another person. Firearms and stabbings are common mechanisms of injury for assaulting someone else, although assaults can result from any mechanism that injures another person intentionally. In 2005:

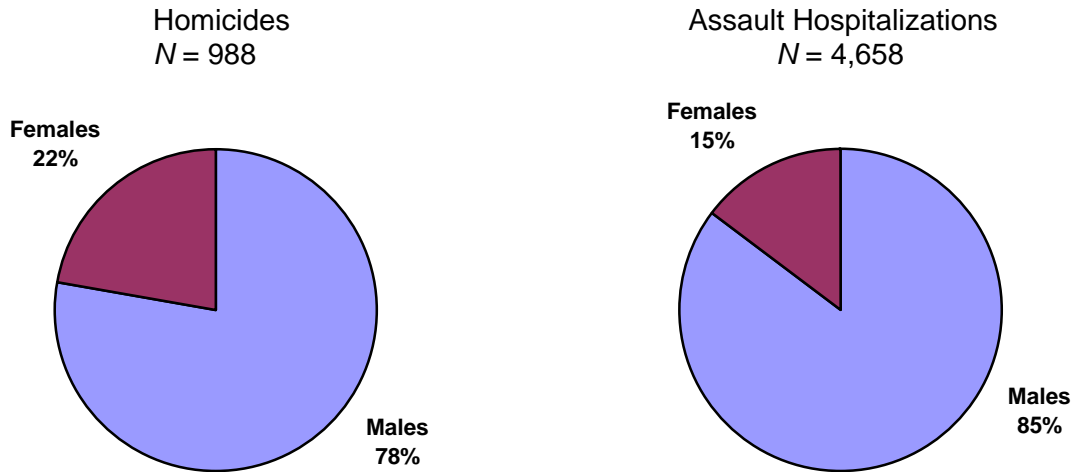

- There were 988 homicides and 4,658 hospitalizations for assault injuries of Florida residents.
- Males made up 78% of homicides and 85% of hospitalizations for assault injuries, while females made up 22% of homicides and 15% of hospitalizations for assault injuries.
- Blacks made up 46% of homicides, Whites 34%, and Hispanics 16%. Whites made up 43% of hospitalizations for assault injuries, Blacks 36%, and Hispanics 16%.
- The top 4 mechanisms of injury for homicides were firearms (64%), stabbings (13%), struck by/against (5%), and suffocation (4%). The top 3 mechanisms of hospitalized assault injuries were struck by/against (36%), stabbings (22%), and firearms (18%).
- Males ages 20-24 had the highest rates of homicides and hospitalizations for assault injuries.

### What is Florida Doing to Reduce Homicides and Assault Injuries?

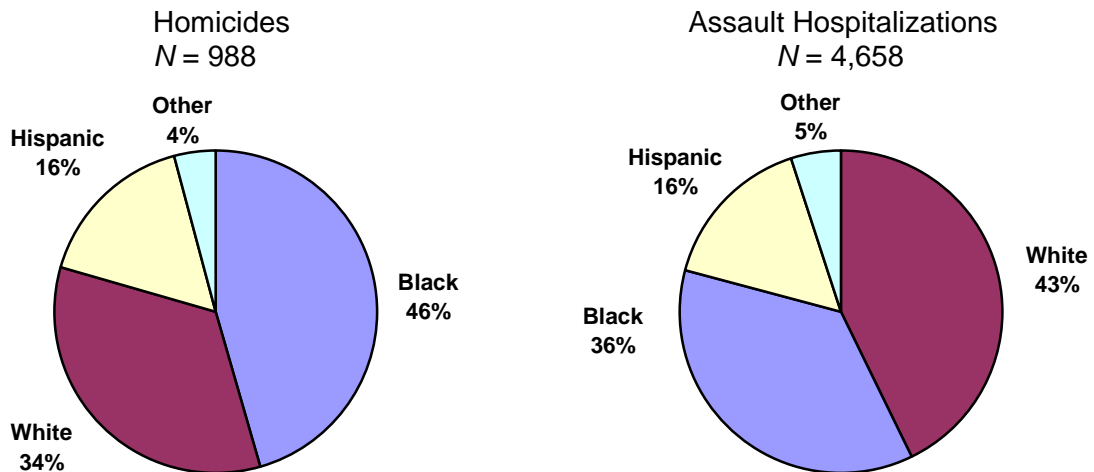

Violence prevention requires the collaboration of public health, law enforcement, social service agencies, faith-based organizations, schools, and other community organizations, to address the root causes of violence, which are often related to crime, drugs, poverty, and other social ills. These are just a few examples of violence prevention programs in Florida:

- NOT ONE MORE: The Miami-Dade Coalition to Prevent Youth Violence
- Turning Point: Rethinking Violence, Shands Jacksonville Medical Center
- Florida Department of Health, Sexual Violence Prevention Program
- Florida Department of Children and Families, Florida Coalition Against Domestic Violence
- The GATE Program is an educational interventional performance based program for male juvenile weapon offenders referred from the Juvenile Justice System. The program is conducted in a medical environment that provides them with information and first-hand exposure to the consequences of violence. The program provides education about gun behaviors and violence, while exposing young offenders to the aftermath of injury and death by weapons and focuses on the traumatic consequences of pediatric victims and their families.

## Unintentional Drownings and Nonfatal Near Drownings

With its warm climate and many natural and man-made bodies of water, drowning and near drowning is a significant public health problem in Florida, especially among young children. In 2005, including all ages:

- There were 382 unintentional drowning deaths and 300 nonfatal near drowning hospitalizations of Florida residents.
- Males made up 81% of unintentional drowning deaths, while females made up 19%. Males made up 67% of nonfatal near drowning hospitalizations, while females made up 33%.
- Whites made up 61% of unintentional drowning deaths, Hispanics 20%, and Blacks 16%. Whites made up 57% of nonfatal near drowning hospitalizations, Blacks 17%, and Hispanics 16%.
- Thirty percent (30%) of unintentional drowning deaths occurred in natural water, 25% in pools, 9% while boating, 5% in bathtubs, and 31% other.
- At least eighty five percent (85%) of nonfatal near drowning hospitalizations were unintentional. Twelve percent (12%) were undetermined or no intent was given.

### Florida Toddler Drowning Deaths Ages 1-4: An Urgent Call to Action

The 5<sup>th</sup> Annual National Drowning Prevention Symposium was held for the first time in Florida in January 2006, bringing national attention to the problem of unintentional drownings in the state, especially of young children ages 1-4.

- Children ages 1-4 have the highest rates of unintentional drowning deaths and nonfatal near drowning hospitalizations. The drowning death rate of Florida resident children ages 1-4 is the highest in the nation.<sup>1</sup>
- Between 1999-2005, fifteen percent (15%) of all children ages 1-4 who drowned in the U.S. were from Florida, the most of any state.<sup>1</sup>
- Over two-thirds (67%) of drowning deaths of Florida children ages 1-4 occurred in swimming pools from 1999-2005.

---

<sup>1</sup> Centers for Disease Control and Prevention. Web-based Injury Statistics Query and Reporting System (WISQARS), 1999-2005. Available at <http://www.cdc.gov/ncipc/wisqars>. Figure A. Unintentional Drowning Death Rates Ages 1-4, Top 3 States, 1999-2005

Figure A. Unintentional Drowning Death Rates Ages 1-4, Top 3 States, 1999-2005

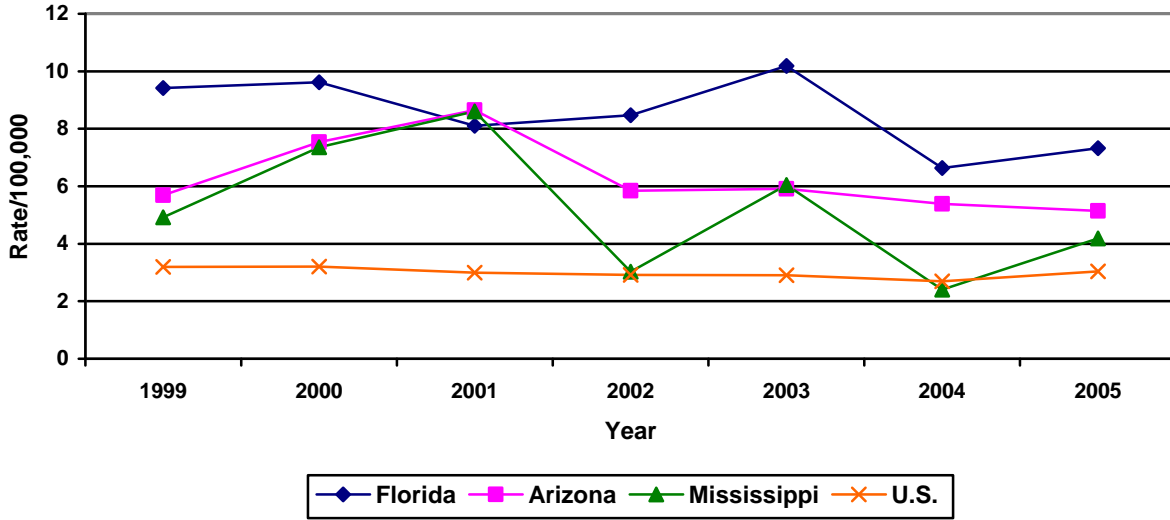

Figure B. Unintentional Drowning Deaths, Ages 1-4, Top 5 States, 1999-2005

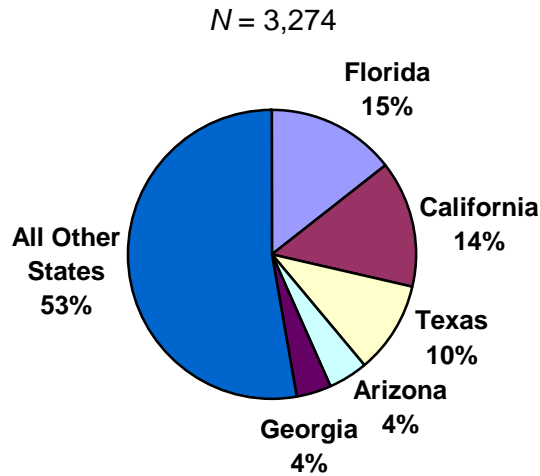

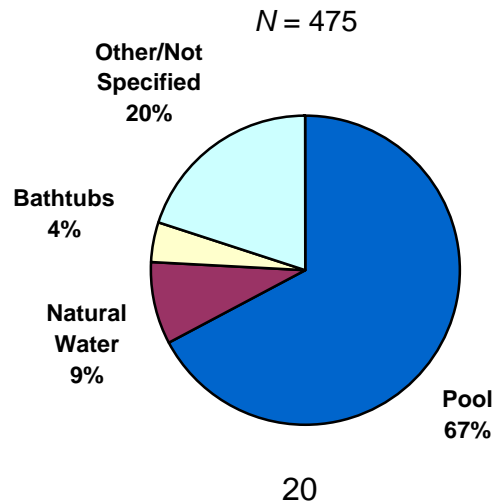

Figure C. Unintentional Drowning Deaths by Place of Occurrence, Florida Children Ages 1-4, 1999-2005

## What is Florida Doing to Prevent Children from Drowning?

In response to these alarming statistics, the Florida Department of Health has set an ambitious goal of zero drownings among children in Florida, starting with the following activities:

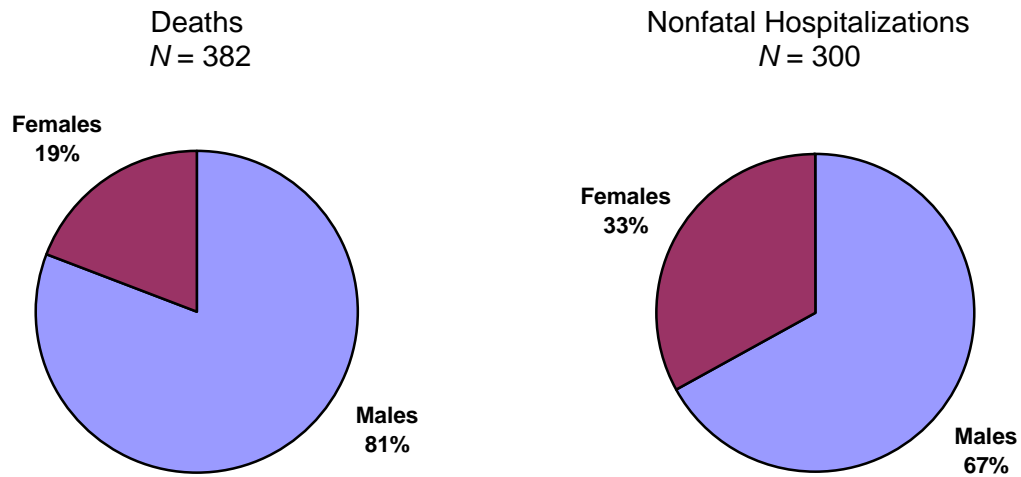

- During the summers of 2006 and 2007, the Office of Injury Prevention implemented the “Keep Your Eyes on the Kids” drowning prevention campaign, in conjunction with county health departments, Children’s Medical Services regional offices, and Safe Kids coalitions and chapters, in counties with the highest numbers of drowning deaths of children ages 1-4.
- In 2006, “Keep Your Eyes on the Kids” included paid drowning prevention television spots produced in partnership with the Ounce of Prevention Fund of Florida that aired in the top 15 counties.
- As the lead agency for Safe Kids Florida, the Office of Injury Prevention formed a unique partnership with Denny’s Restaurants in 2006 to educate patrons about child safety issues through Denny’s Kids Safety Zone Program. Each quarter a different child safety subject was featured. Drowning prevention and water safety was the subject of the second quarter of 2006 and began on May 6, 2006 at a Denny’s Restaurant in Tampa.
- The Office of Injury Prevention hosted a Drowning Prevention Marketing Symposium on May 15, 2006 in Tampa and July 18, 2007 in Fort Lauderdale, bringing the following traditional and non-traditional partners to work together to prevent children ages 1-4 from drowning in Florida:

AAA Auto Club South	Parents of Drowning Victims
All Children’s Hospital	Safe Kids Worldwide
American Red Cross	Arizona’s Water Watchers Program
St. Joseph’s Children’s Advocacy Center	Child Safety Solutions
Tampa Metro Area YMCA	Denny’s Restaurants
United Pool and Spa Association	Florida Swimming Pool Association
U.S. Consumer Product Safety Commission	Ounce of Prevention Fund of Florida
County Health Departments	Miami Children’s Hospital
Department of Children and Families	Jackson Memorial Hospital
Joe DiMaggio Children’s Hospital	Marino SWIM Central Adaptive Aquatics
Nova Southeastern University	Miami-Dade County Public Schools
Memorial Healthcare System	Comerica Bank
Florida Brain & Spinal Cord Injury Program	Centers for Disease Control and Prevention
Safe Kids Tampa	

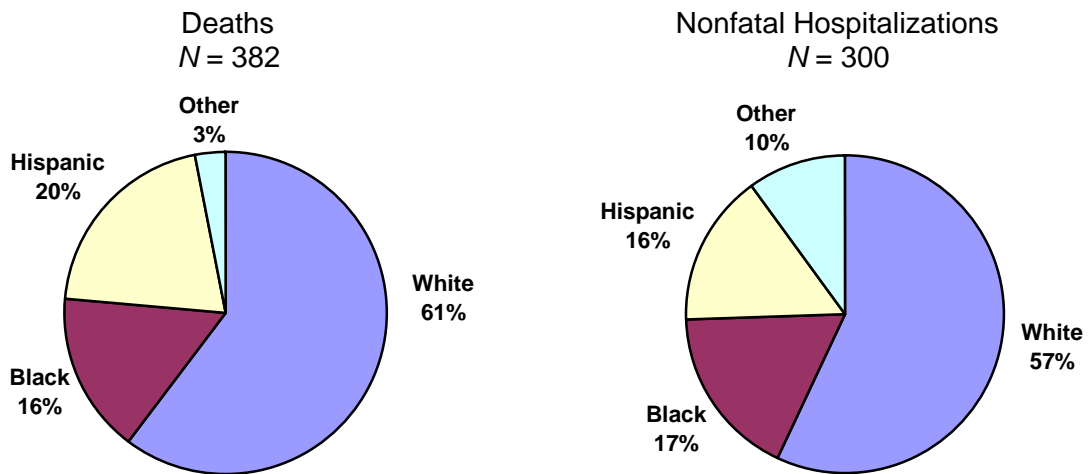

- In 2006, workgroups on marketing, funding, and building partnerships for collaboration were formed and met by conference calls coordinated by the Office of Injury Prevention on a periodic basis, working to advance the goals of the Marketing Symposium. Similar internal workgroups were formed at the Florida Department of Health’s Central Office.

- A survey of Florida county property appraisers' offices conducted by the Office of Injury Prevention in 2006, found approximately 1.1 million residential in-ground swimming pools recorded on county property tax rolls statewide. About 21% of these pools were built after October 1, 2000, when the state's Residential Swimming Pool Safety Act went into effect, which requires the installation of one of four pool safety features.
- In 2006, a review of 58 toddler pool drowning deaths occurring between 2003-2006 in Florida that were investigated by the U.S. Consumer Product Safety Commission, found that 71% of these cases had accessed the pool through a door leading from the home to the pool area, and that most drownings had occurred while the caregiver was engaged in a routine household activity that had allowed a lapse in supervision of the toddler to occur.
- In 2006, the Florida Department of Health (FDOH) presented on drowning prevention activities at the Florida Swimming Pool Association's (FSPA) 2006 Swimming Pool Safety Forum. Collaboration will continue with this important partner when FDOH and FSPA host a joint Water Safety Forum/Drowning Prevention Marketing Symposium in April 2008.
- A Drowning Prevention Initiative Workgroup Meeting was held at the Broward County Health Department on October 27, 2006, during which drowning statistics and drowning prevention best practices from Australia and the City of Phoenix, Arizona (which had zero drowning deaths of children during the summer of 2006) were shared by the Office of Injury Prevention with county health department staff and local stakeholders from Broward and Miami-Dade counties. Plans for a drowning prevention pilot project in these two counties were submitted to the Office of Injury Prevention in November 2006. Mail-based surveys and focus groups were employed throughout 2007 to collect information on drowning prevention knowledge and practices among residents of the two counties. This information will be used to further develop plans for the pilot projects.

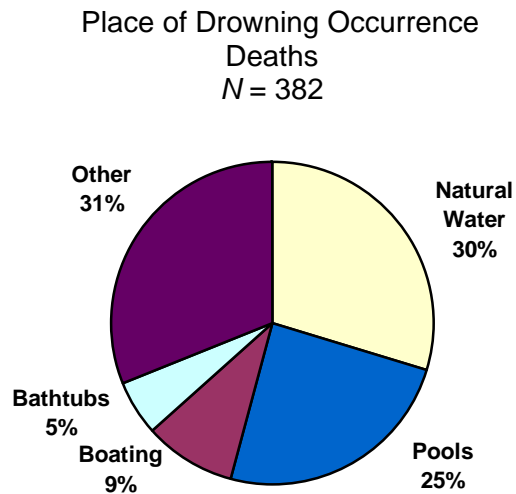

Figure 25. Age-Specific Unintentional Drowning Death Rates by Sex and Age Group

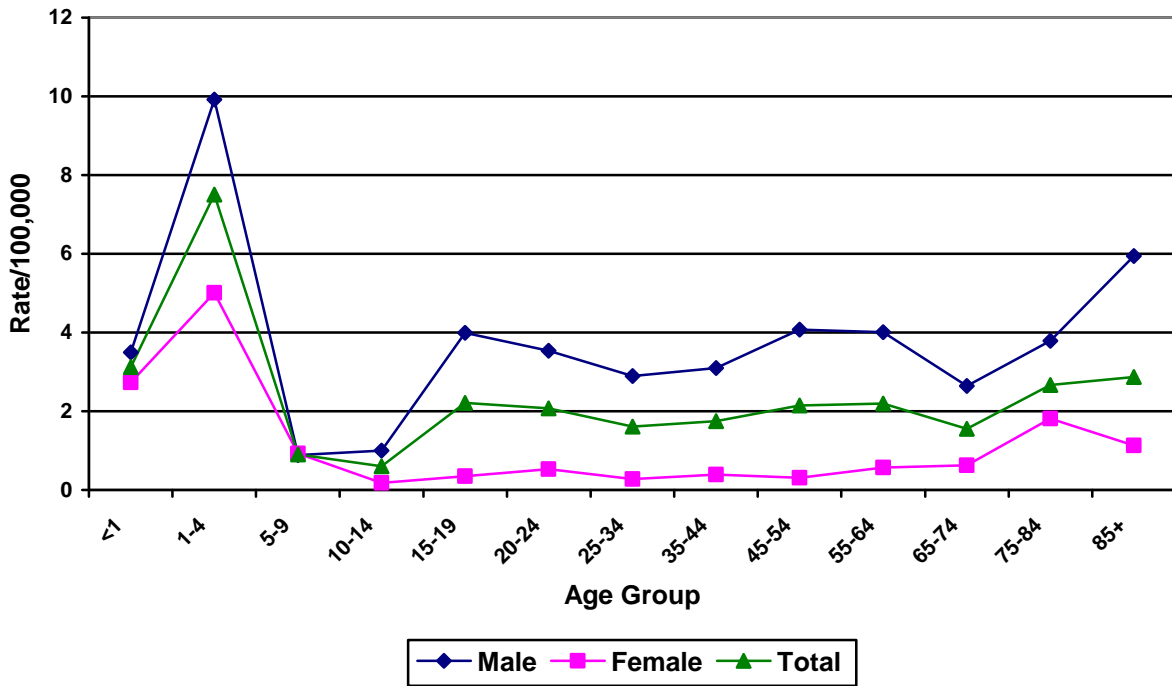

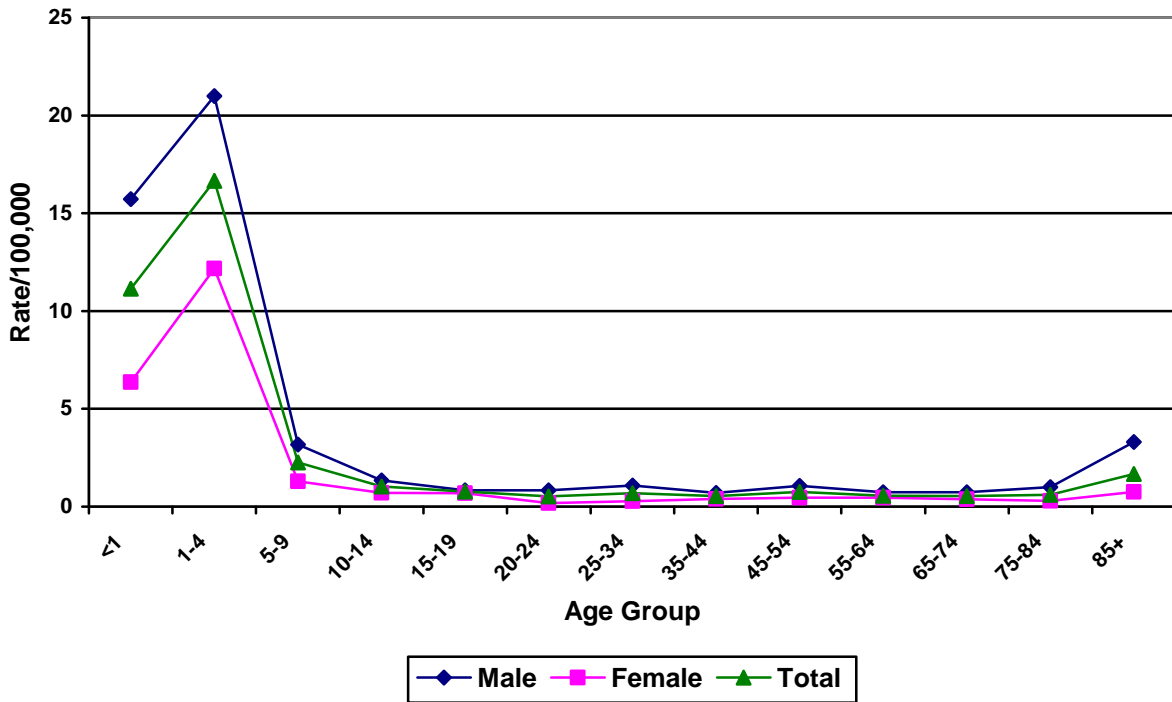

Figure 26. Age-Specific Nonfatal Near Drowning Hospitalization Rates by Sex and Age Group

## Unintentional Falls

Fall-related injuries occur most often among the elderly, especially after age 75. With 17% of Florida's resident population aged 65 and older in 2005, fall-related injuries are a significant cause of injury mortality and morbidity, especially hospitalizations, that is only expected to increase in coming years, as the state's senior population continues to grow. In 2005:

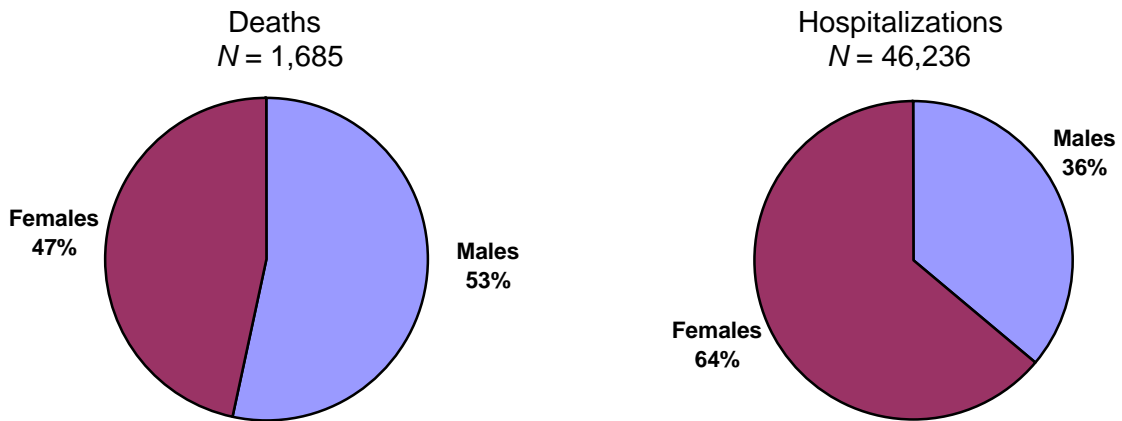

- There were 1,685 deaths and 46,236 hospitalizations due to unintentional fall-related injuries of Florida residents.
- Unintentional fall-related deaths made up 14% of all injury deaths and 19% of all unintentional injury deaths.
- Unintentional falls were the leading cause of all injury hospitalizations (40%) and the leading cause of all unintentional injury hospitalizations (55%).
- Males made up 53% of unintentional fall-related deaths, but only 36% of hospitalizations. Females made up 47% of unintentional fall-related deaths, but 64% of hospitalizations.
- Whites made up 86% of unintentional fall-related deaths, Hispanics 8%, and Blacks 5%. Similarly, Whites made up 81% of unintentional fall-related hospitalizations, Hispanics 12%, and Blacks 5%.
- Over three-quarters of fatal unintentional falls and one-quarter of hospitalized unintentional falls occurred at home or in residential institutions (two-thirds of hospitalizations did not indicate place of fall occurrence).
- After age 65, the rates of fall-related deaths and hospitalizations increase exponentially to their highest rates. Males ages 65 and over had the highest unintentional fall-related death rates, while females ages 65 and over had the highest unintentional fall-related hospitalization rates.

### What is Florida Doing to Reduce Fall-Related Injuries?

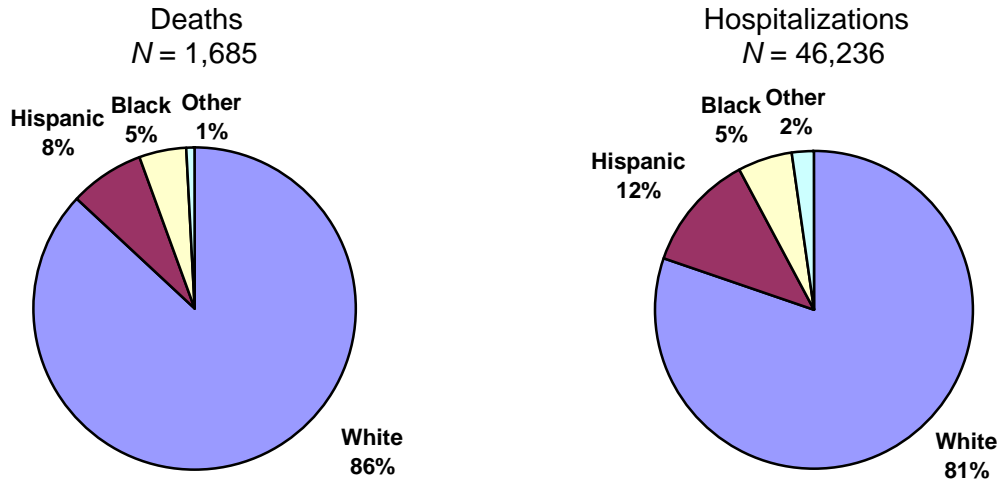

The Department of Elder Affairs and Communities for a Lifetime are working to provide seniors the opportunity to remain healthy and independent in their own communities. A focus is on increased safety through improved coordination of transportation, community planning, universal home designs, and neighborhood interaction.

The Florida Association of Area Agencies on Aging meets on a regular basis to share data, plan advocacy activities and design coordinated aging programs. The eleven partner organizations work closely with the Florida Department of Elder Affairs to develop effective and efficient projects benefiting a large number of Florida's constituency of over three and a half million seniors.

**Figure 30. Age-Specific Unintentional Fall-Related Death Rates by Sex and Age Group**

**Figure 31. Age-Specific Unintentional Fall-Related Hospitalization Rates by Sex and Age Group**

## Unintentional Fires

Thanks to advances in fire safety, rescue, and prevention, deaths from fires have declined over the years to the low rates seen today, both nationally and in Florida,<sup>1</sup> However, significant disparities still exist, as Florida's seniors ages 75 and over had 2-3 times the death rate from unintentional fire-related injuries in 2005 than the general population. In 2005:

- There were 133 unintentional fire-related deaths and 501 unintentional fire-related hospitalizations of Florida residents.
- Males made up 66% of unintentional fire-related deaths and 76% of unintentional fire-related hospitalizations, while females made up 34% of unintentional fire-related deaths and 24% of unintentional fire-related hospitalizations.
- Whites made up more than two-thirds of unintentional fire-related deaths and hospitalizations, and Hispanics made up 8% of deaths and 12% of hospitalizations. Blacks made up 15% of unintentional fire-related hospitalizations and 20% of unintentional fire-related deaths.
- Eighty-seven percent (87%) of fatal unintentional fire-related injuries and at least 23% of unintentional fire-related injuries resulting in hospitalization occurred at home (62% of hospitalizations did not indicate place of fire occurrence).
- Females ages 85 and over had the highest unintentional fire-related death rate that was 3 times higher than the general population rate. Males ages 15-19 had the highest unintentional fire-related hospitalization rate that was 2.5 times higher than the general population rate.

### What is Florida Doing to Reduce Fire-Related Injuries?

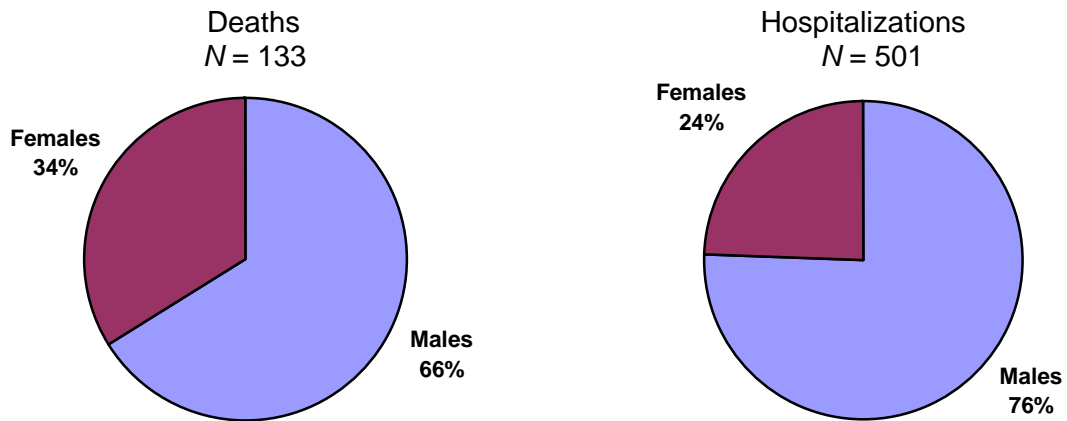

Members of the Florida Association of Fire and Life Safety Educators (a section of the Florida Fire Marshals and Inspectors Association), and the Florida Society of Public Fire and Life Safety Educators (a section of the Florida Fire Chiefs' Association), both offer active programs of fire and life safety education through the fire service in communities throughout Florida.

The Department of Elder Affairs and Communities for a Lifetime are working to provide seniors the opportunity to remain healthy and independent in their own communities. A focus is on increased safety through improved coordination of transportation, community planning, universal home designs, and neighborhood interaction.

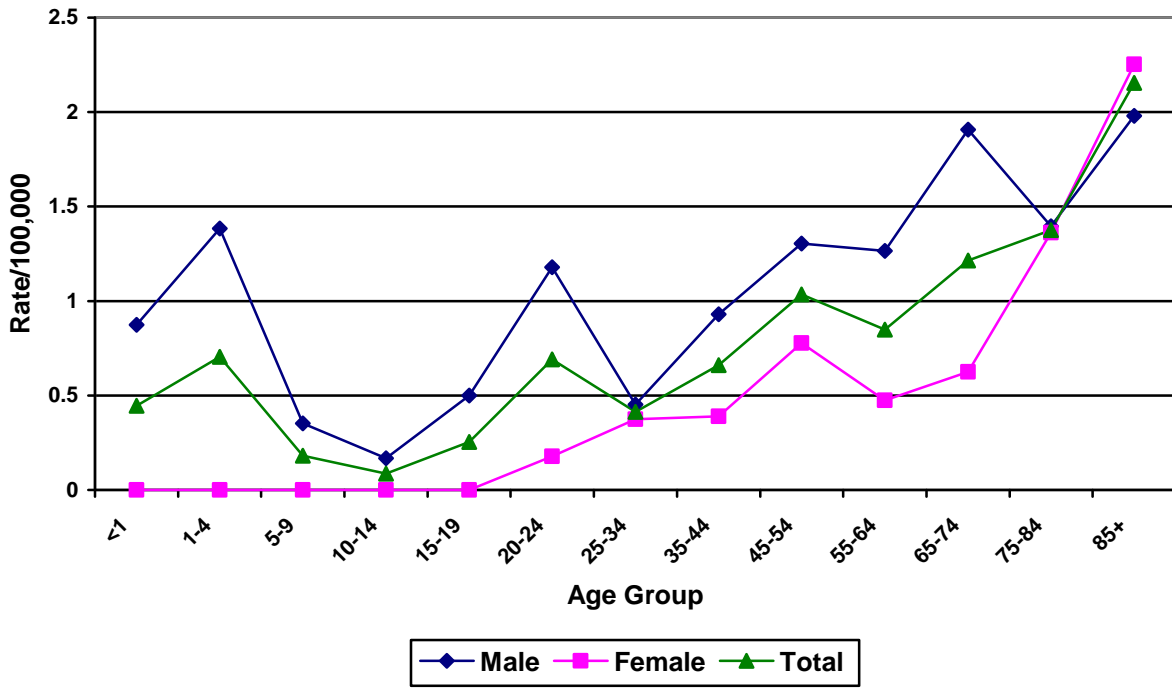

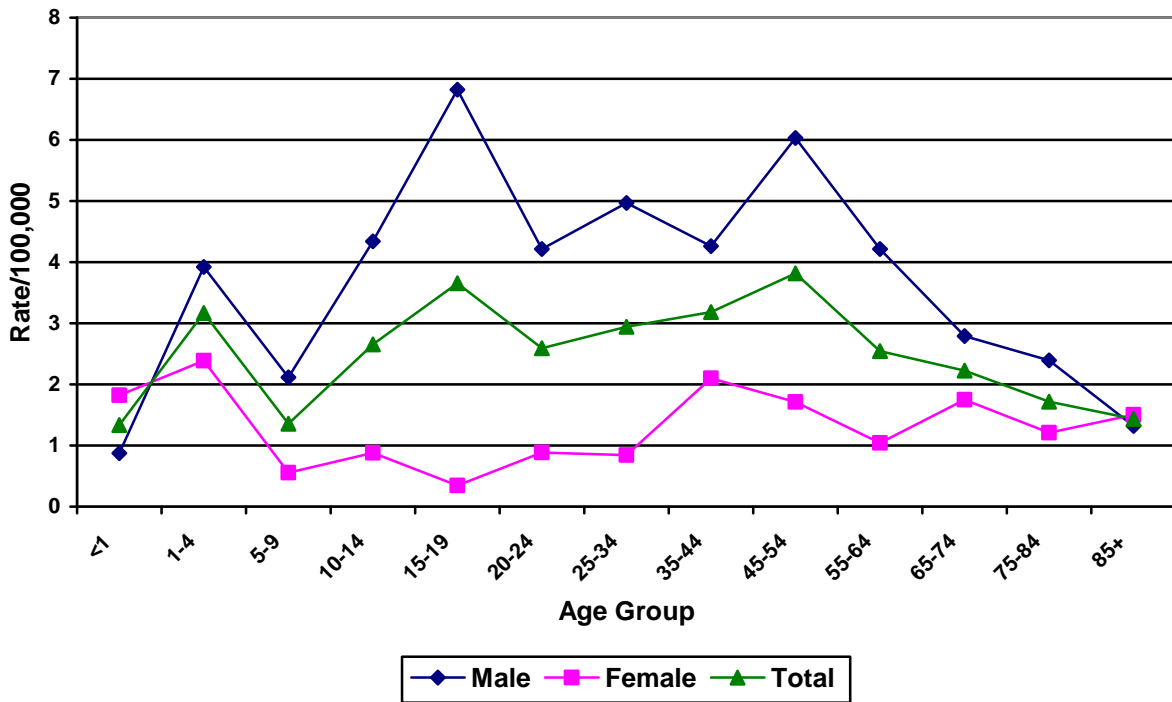

Figure 36. Age-Specific Unintentional Fire-Related Hospitalization Rates by Sex and Age Group

## Firearms

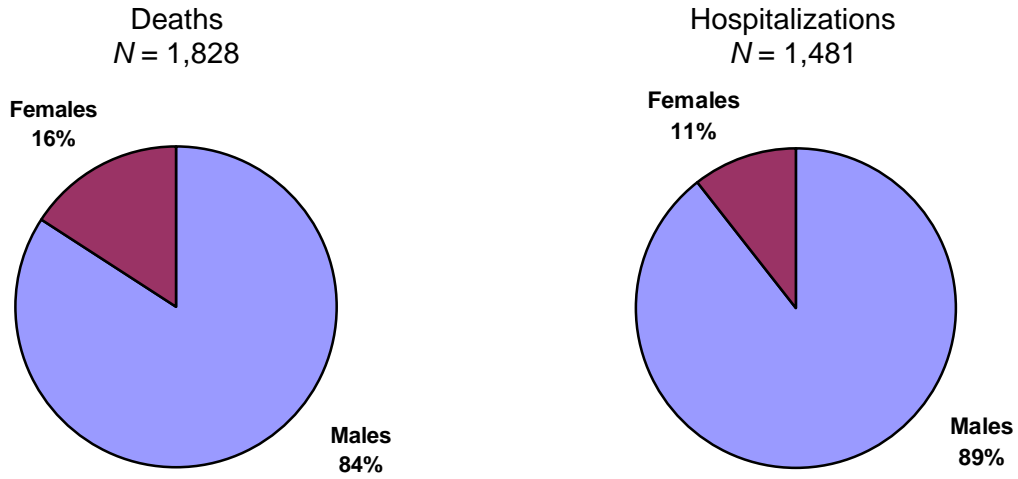

Firearm injuries are a leading cause of injury mortality, especially among adult males. While a quarter of firearm-related hospitalizations of Florida residents in 2005 were for unintentional firearm injuries, nearly all firearm-related fatalities were the result of intentional acts of violence (suicides and homicides). In 2005:

- There were 1,828 deaths and 1,481 hospitalizations due to firearm injuries of Florida residents.
- Firearms were the 3<sup>rd</sup> leading cause of all injury fatalities of Florida residents (15%), after motor vehicle traffic and non-traffic (29%) and poisonings (21%).
- Males made up the majority of firearm deaths (84%) and hospitalizations (89%).
- While Whites made up two-thirds of firearm deaths, they made up one-third of firearm hospitalizations. On the other hand, while Blacks made up less than a quarter of firearm deaths, they made up over half of firearm hospitalizations. Hispanics made up 10% of firearm deaths and 12% of firearm hospitalizations.
- About two-thirds of firearm deaths were the result of suicides, and about one-third were the result of homicides. Assaults made up 58% of firearm hospitalizations, unintentional firearm injuries 29%, suicide attempts 7%, and undetermined intent 6%.
- Males ages 85 and over had the highest firearm death rate, while males ages 20-24 had the second highest firearm death rate and the highest firearm hospitalization rate.

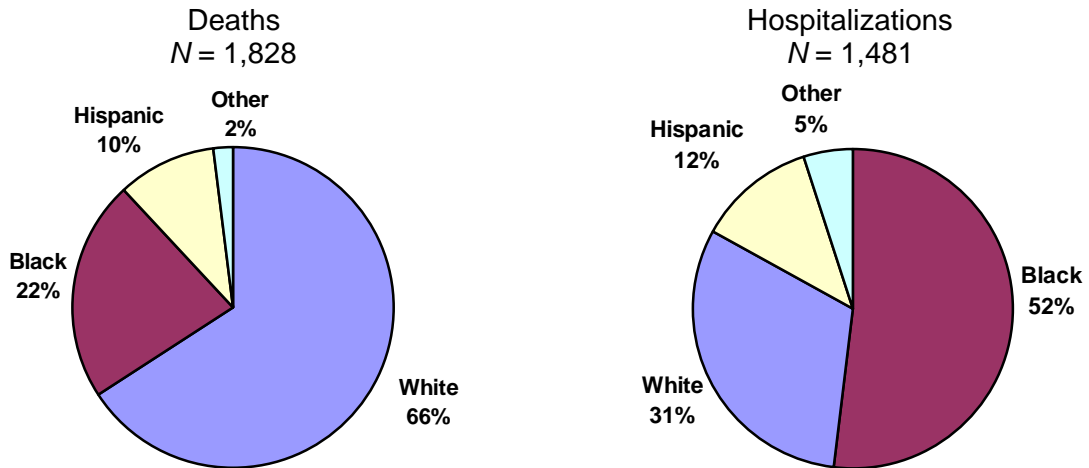

### What is Florida Doing to Reduce Firearm Injuries?

- Florida Statute 790.174 requires safe storage of firearms to prevent access to minors.
- Community violence prevention programs such as NOT ONE MORE: The Miami-Dade Coalition to Prevent Youth Violence sponsor gun buy-back and gun lock give-away events to reduce the risk of injuries from firearms in the community.
- Law enforcement is one of the key stakeholder constituencies represented on the Florida Injury Prevention Advisory Council.

**Figure 39. Firearm Deaths and Hospitalizations by Intent of Injury**

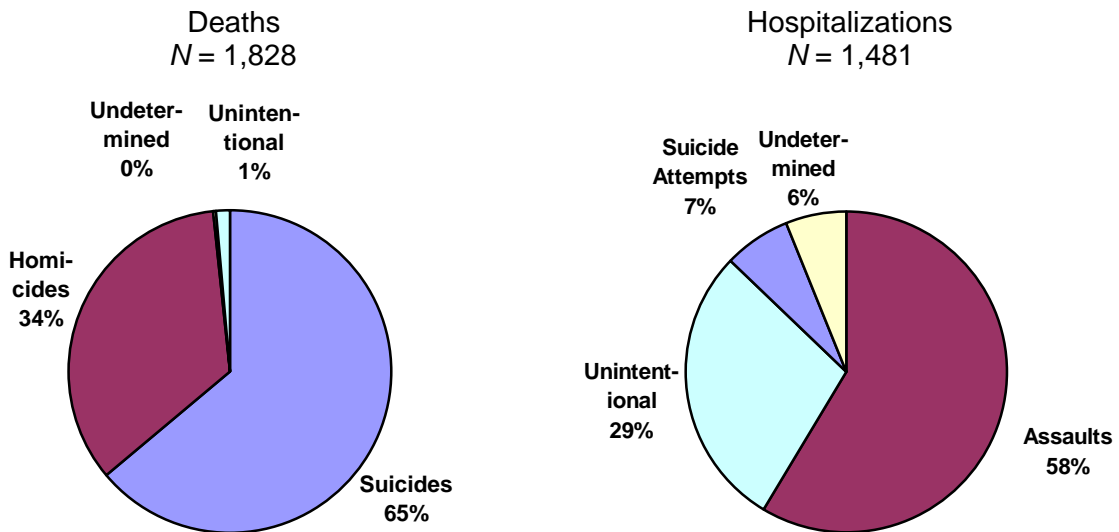

Figure 40. Age-Specific Firearm Death Rates by Sex and Age Group

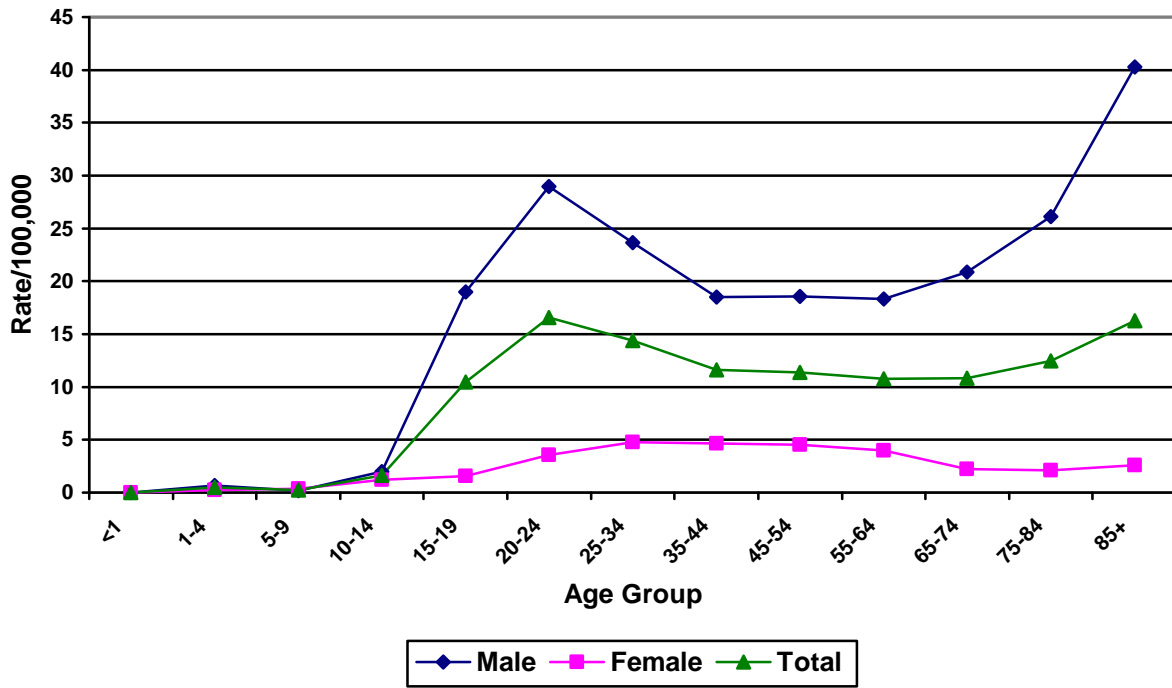

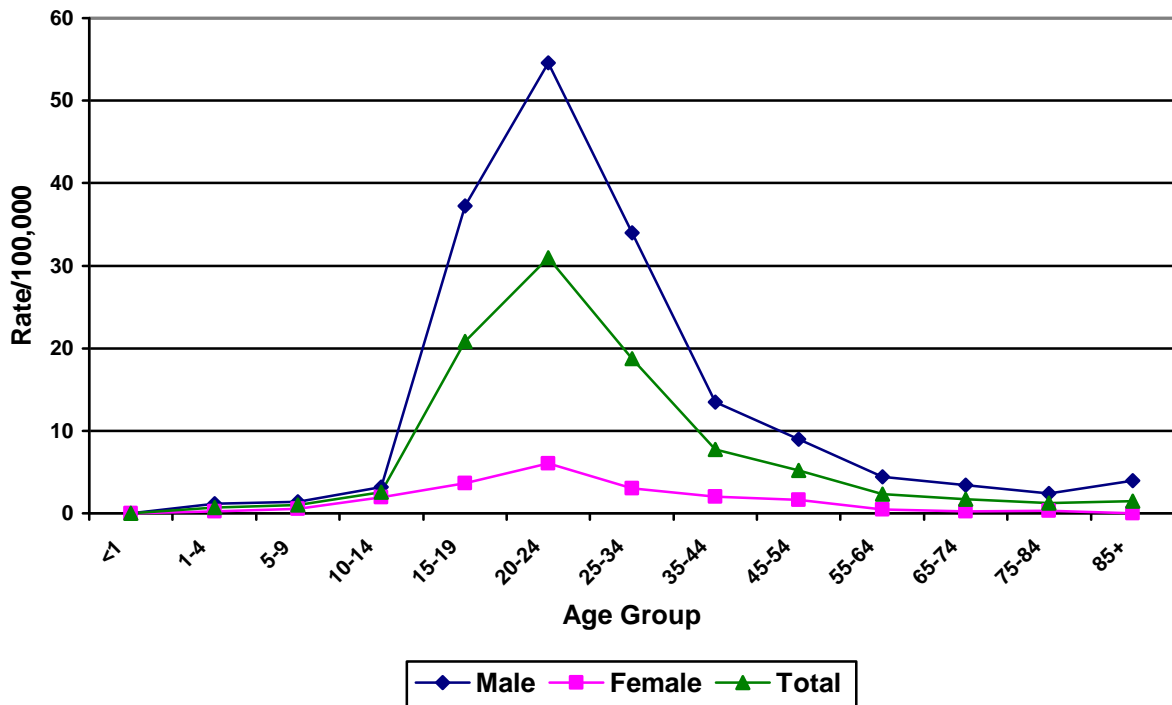

Figure 41. Age-Specific Firearm Hospitalization Rates by Sex and Age Group

## Motor Vehicle Accidents

Between 1999-2004, Florida had the highest motor vehicle traffic injury death rate among the five largest states in the nation (California, Texas, New York, Florida, and Illinois) that was 23% higher than the national rate.<sup>1</sup> A study released in 2004 found that five of the top 10 most dangerous cities in the nation for pedestrians were in Florida.<sup>2</sup> A secondary enforcement seat belt law, lack of a child booster seat law, and the repeal of a universal motorcycle helmet law in 2000 present additional challenges to traffic safety in Florida's motoring environment. In 2005:

- There were 3,491 deaths and 16,893 hospitalizations of Florida residents due to motor vehicle accidents.
- Males made up 72% of motor vehicle accident-related deaths and 64% of motor vehicle accident-related hospitalizations. Females made up 28% of motor vehicle-related deaths and 36% of motor vehicle-related hospitalizations.
- Whites made up 6% of motor vehicle accident-related deaths, Hispanics 20%, and Blacks 13%. Similarly, Whites made up 64% of motor vehicle accident-related hospitalizations, Hispanics 17%, and Blacks 14%.
- Motor vehicle occupants made up 68% of motor vehicle accident-related deaths, pedestrians 16%, motorcyclists 13%, and pedal cyclists 3%. Motor vehicle occupants made up 70% of motor vehicle accident-related hospitalizations, motorcyclists 17%, pedestrians 10%, and pedal cyclists 3%.
- Males ages 20-24 had the highest motor vehicle accident-related death and hospitalization rates.

### What is Florida Doing to Reduce Motor Vehicle Traffic Injuries?

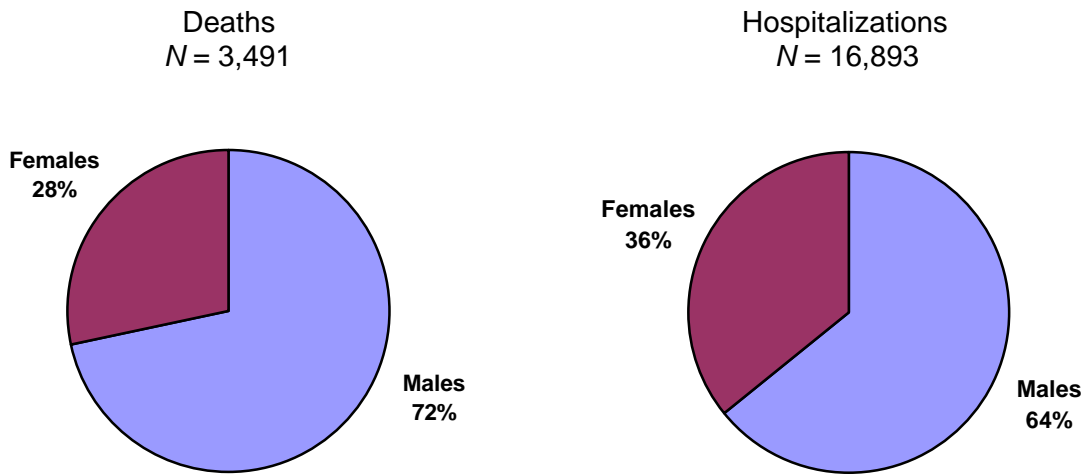

- The Florida Department of Transportation and its traffic safety partners have developed a new Strategic Highway Safety Plan, supported by a State Traffic Safety Information System Improvement Grant from the National Highway Traffic Safety Administration that was rolled out in September 2006.
- Supported by grants from the Florida Department of Transportation, the Florida Department of Health, Office of Injury Prevention administers the Florida Special Needs Occupant Protection Program and the Florida Bicycle Helmet Promotion Program.
- Beginning in 2007, ten Florida trauma centers are implementing WalkSafe, a school-based pediatric pedestrian safety program led by Dr. Gillian Hotz of Jackson Memorial Hospital/Ryder Trauma Center in Miami and funded by a grant from the Florida Department of Health, Bureau of Emergency Medical Services.

**Figure 45. Age-Specific Motor Vehicle Accident-Related Injury Death Rates by Sex and Age Group**

**Figure 46. Age-Specific Motor Vehicle Accident-Related Injury Hospitalization Rates by Sex and Age Group**

## Poisonings

Poisonings are a leading cause of both injury mortality and morbidity. While over half of hospitalizations of Florida residents in 2005 for poisonings were the result of intentional self-poisonings, most poisoning deaths are unintentional. A 2004 study found that Florida's death rate from unintentional and undetermined poisonings jumped 325% between 1990-2001.<sup>1</sup> In 2005:

- There were 2,489 poisoning deaths and 13,737 hospitalizations for poisonings of Florida residents.
- Males made up 65% of poisoning deaths and females made up 35%, whereas females made up 55% of poisoning hospitalizations and males made up 45%.
- Whites made up 86% of poisoning deaths, Hispanics 7%, and Blacks 6%. Whites made up three-quarters of poisoning hospitalizations, and Hispanics and Blacks 11% each.
- More than three-quarters of poisoning deaths were unintentional, 18% were suicides, and 4% were undetermined. On the other hand, over half of poisoning hospitalizations resulted from suicide attempts, 33% were unintentional, and 14% were undetermined.
- Thirty-five percent (35%) of poisoning deaths resulted from poisonings by narcotics and psychodysleptics (hallucinogens), which include cannabis and its derivatives, cocaine, codeine, heroin, lysergide (LSD), mescaline, methadone, morphine, and opium (alkaloids).
- Thirty-two percent (32%) of poisoning hospitalizations resulted from poisonings by tranquilizers and other psychotropic agents, and 22% resulted from poisonings by opioids and narcotics.
- Males ages 45-54 had the highest poisoning death rate, while females ages 35-44 had the highest poisoning hospitalization rate.

### What is Florida Doing to Reduce Poisonings?

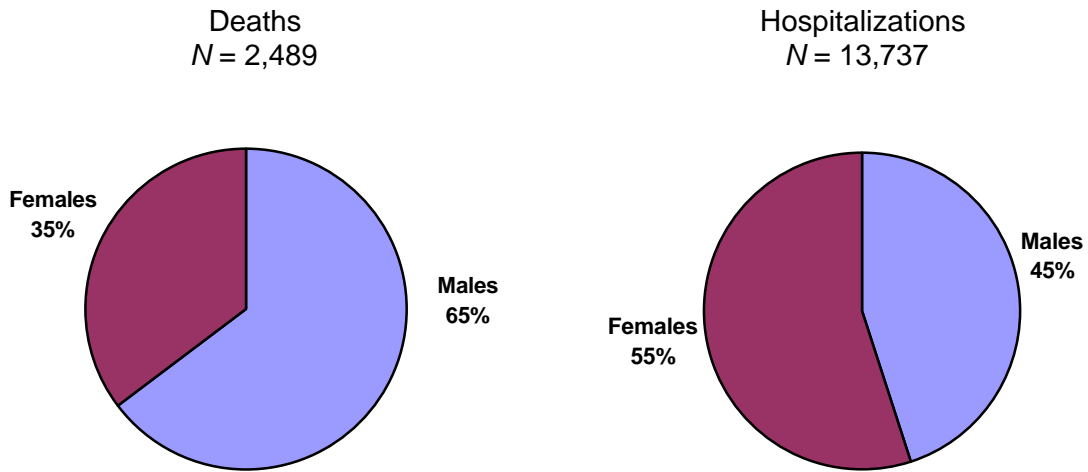

- With call centers in Jacksonville, Tampa, and Miami, the Florida Poison Information Center Network (FPICN) provides emergency poison prevention and management information 24 hours a day to calls made within Florida to the national poison prevention hotline (1-800-222-1222). FPICN is one of the key stakeholders represented on the Florida Injury Prevention Advisory Council.

---

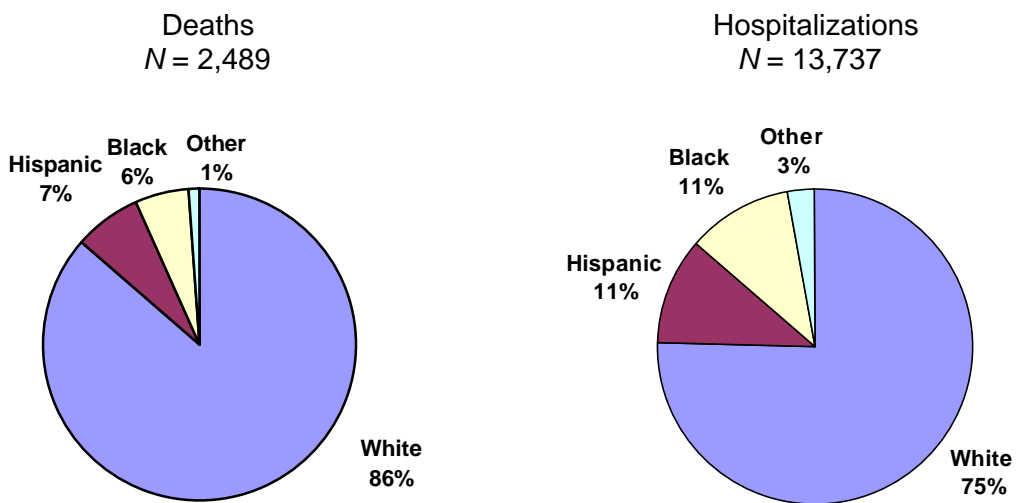

<sup>1</sup> Centers for Disease Control and Prevention. Unintentional and undetermined poisoning deaths ---11 states, 1990—2001. *Morbidity and Mortality Weekly Report* 53(11); 233-238.

- Working in partnership with other state and federal agencies, community organizations, and law enforcement, the Florida Office of Drug Control was established in the Executive Office of the Governor to coordinate the state's drug control efforts, utilizing a three-pronged approach of prevention, treatment, and law enforcement.
- The Florida Department of Health has been working to raise awareness of the danger of unintentional carbon monoxide poisoning resulting from improper ventilation of gasoline-powered portable electric generators. This public health threat emerged as 8 hurricanes impacted the state in 2004-2005.
- In 2007, the Florida Department of Health participated in a nationwide assessment by the Association of State and Territorial Health Officials (ASTHO) concerning prescription drug abuse, overdose, and death. This assessment will provide the nation and state with valuable information on effective prevention strategies and epidemiological research.

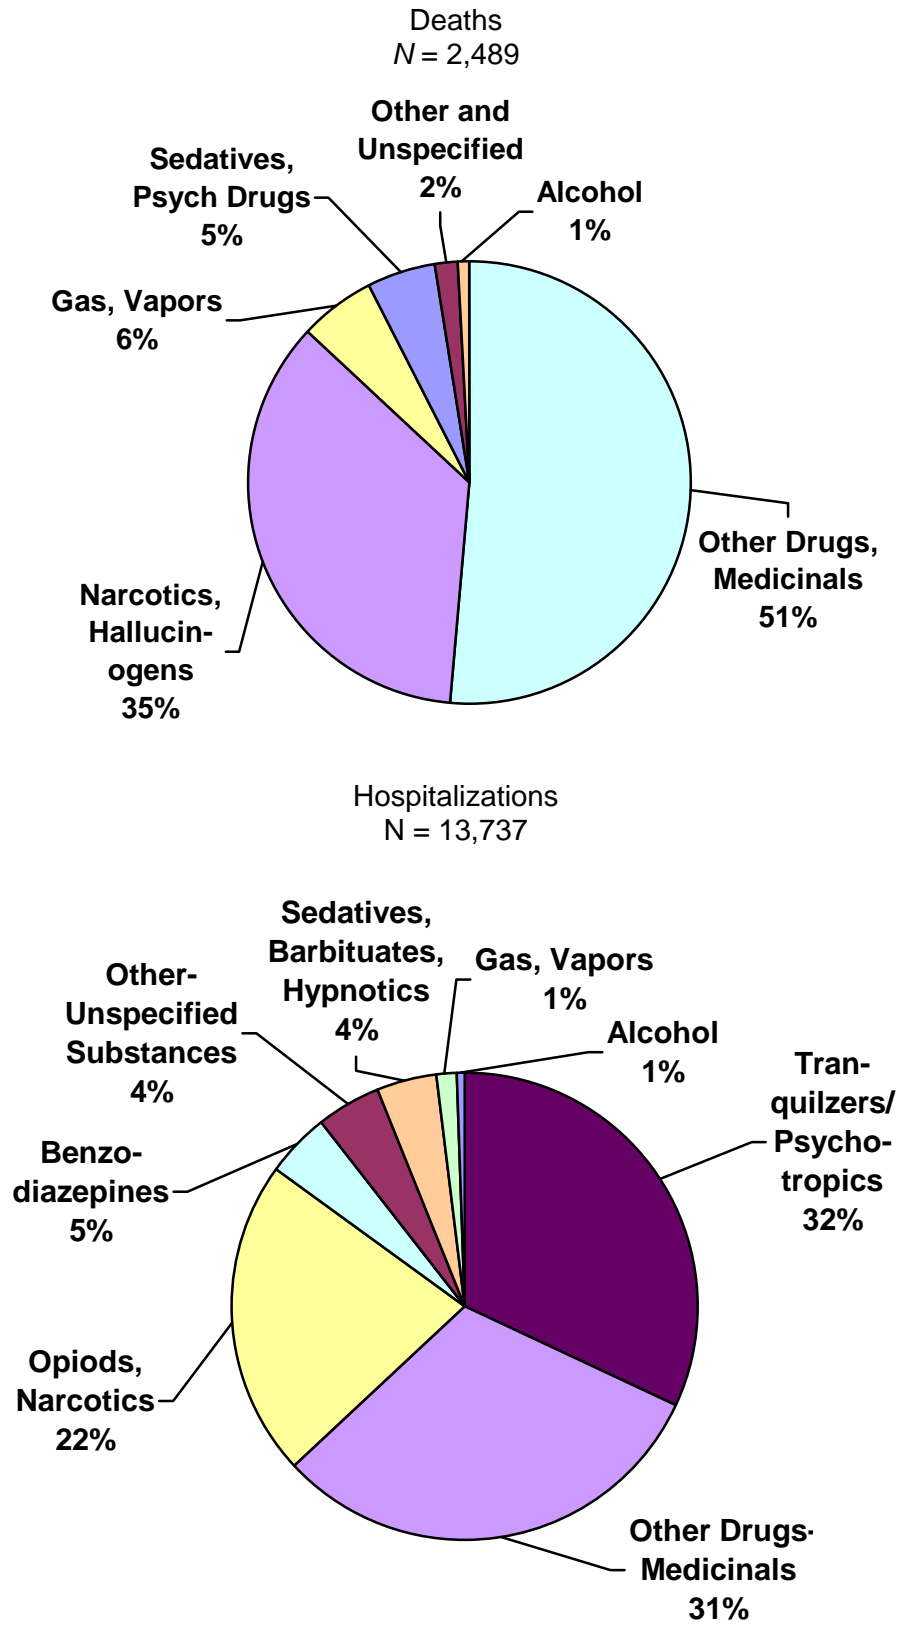

Figure 51. Age-Specific Poisoning Death Rates by Sex and Age Group

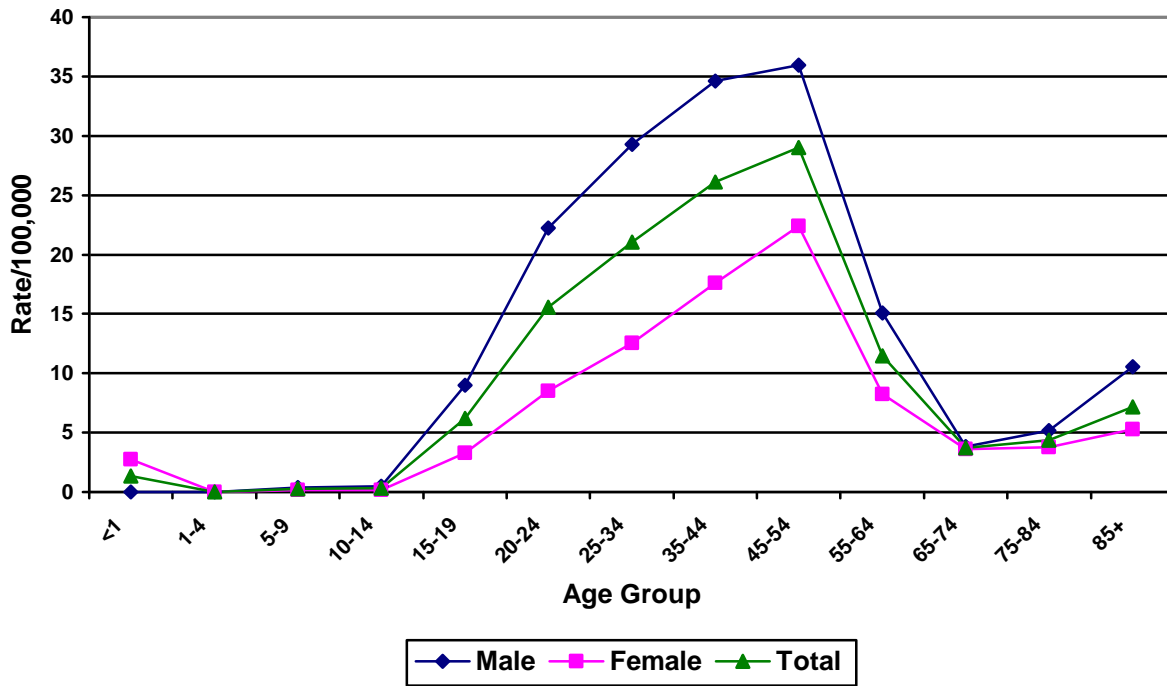

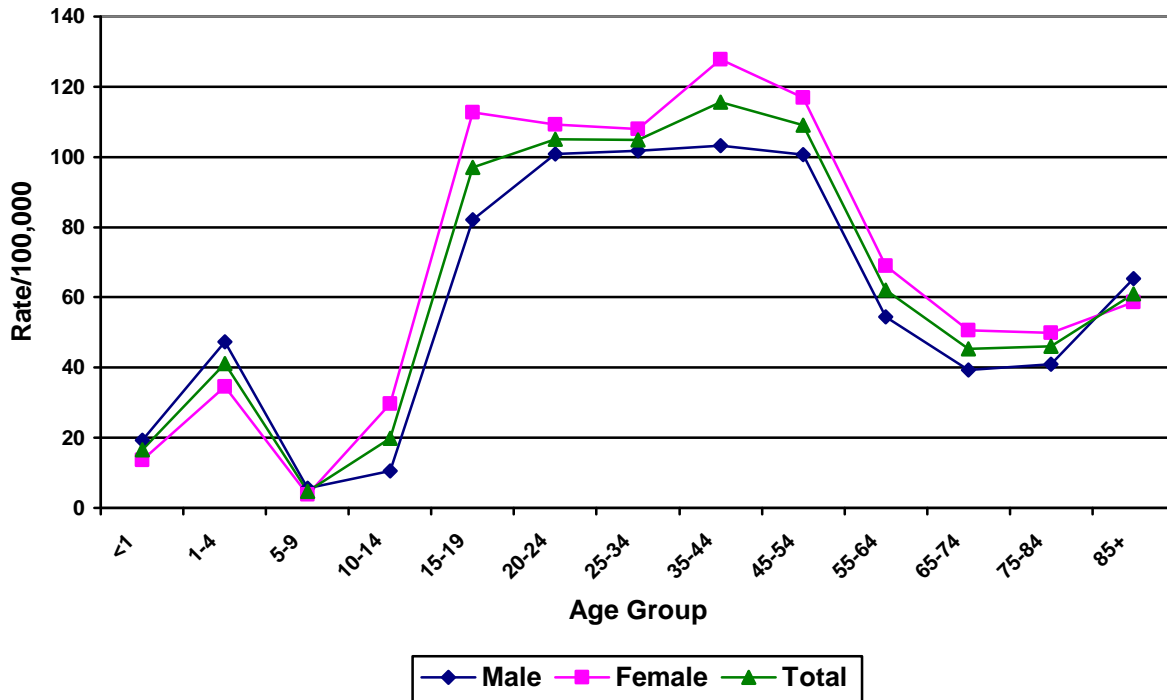

Figure 52. Age-Specific Poisoning Hospitalization Rates by Sex and Age Group

## Traumatic Brain Injuries

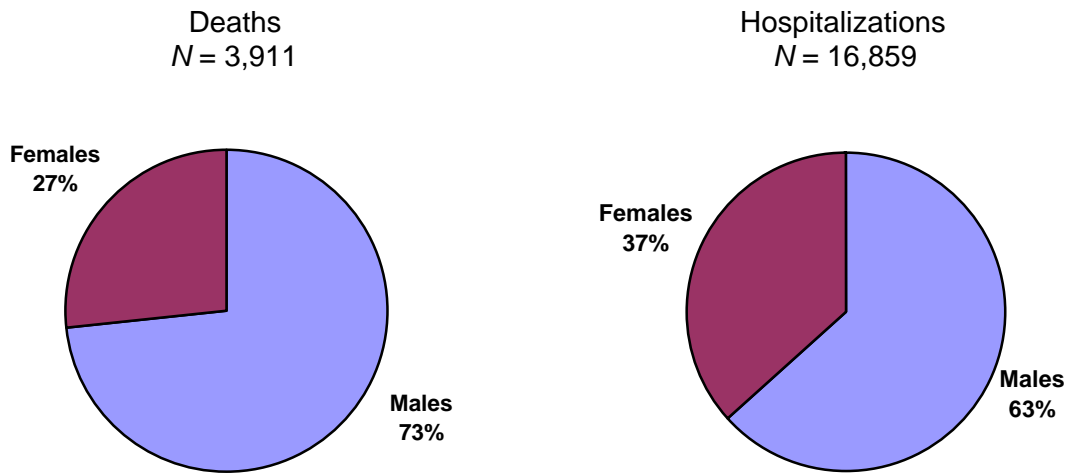

Traumatic brain injury (TBI) is one of the leading types of injury to the body. Thirty-one percent (31%) of all injury deaths of Florida residents in 2005 had a TBI diagnosis documented as a contributing cause of death, and 14% of all hospitalizations for injuries had TBI documented as a principal or secondary diagnosis. In addition, there are an unknown number of mild TBI cases in the general population that go untreated and undiagnosed. In 2005:

- There were 3,911 deaths of Florida residents in which a TBI diagnosis was documented as an immediate and/or contributing cause of death. There were 16,859 hospitalizations for injuries of Florida residents in which TBI was documented as a principal or secondary diagnosis.
- Males made up almost three-quarters of TBI deaths and almost two-thirds of TBI hospitalizations, while females made up more than one-quarter of TBI deaths and more than one-third of TBI hospitalizations.
- Whites made up nearly three-quarters of TBI deaths, Hispanics 13%, and Blacks 11%. Similarly, Whites made up 69% of TBI hospitalizations, Hispanics 15%, and Blacks 11%.
- The top three mechanisms of TBI deaths were motor vehicle traffic and non-traffic (33%), firearms (31%), and falls (23%). The top three mechanisms of TBI resulting in hospitalizations were falls (33%), motor vehicle traffic and non-traffic (31%), and struck by/against (7%), while 18% of TBI hospitalizations did not indicate a mechanism of injury.
- Traumatic brain injury-related death and hospitalization rates increase exponentially after age 65. Males ages 85 and up had the highest rates overall.

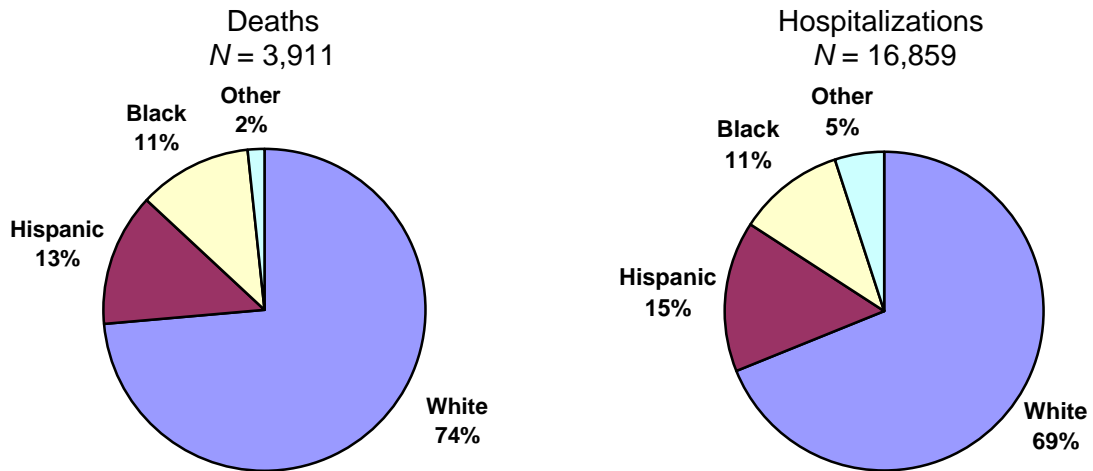

### What is Florida Doing to Reduce Traumatic Brain Injuries?

- The Florida Department of Health's Brain and Spinal Cord Injury Program (BSCIP), a nationally recognized program serving brain and spinal cord injured patients in Florida, and its private sector partner, the Brain Injury Association of Florida (BIAF), sponsor education and prevention programs on brain injury. BSCIP and BIAF are key stakeholders represented on the Florida Injury Prevention Advisory Council.
- Trauma centers throughout Florida provide injury prevention education to their patients.

**Figure 55. Traumatic Brain Injury Deaths and Hospitalizations by Mechanism of Injury**

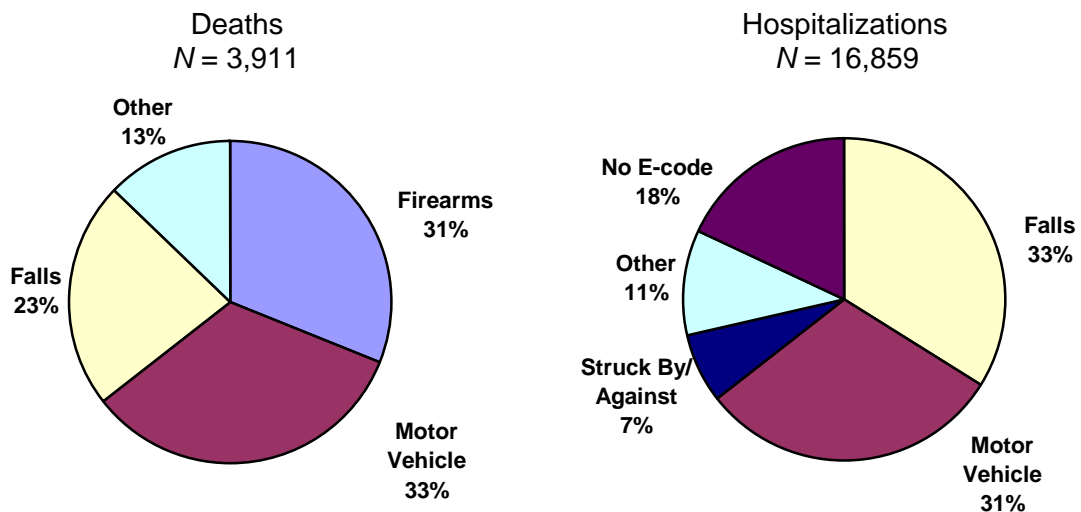

Figure 56. Age-Specific Traumatic Brain Injury Death Rates by Sex and Age Group

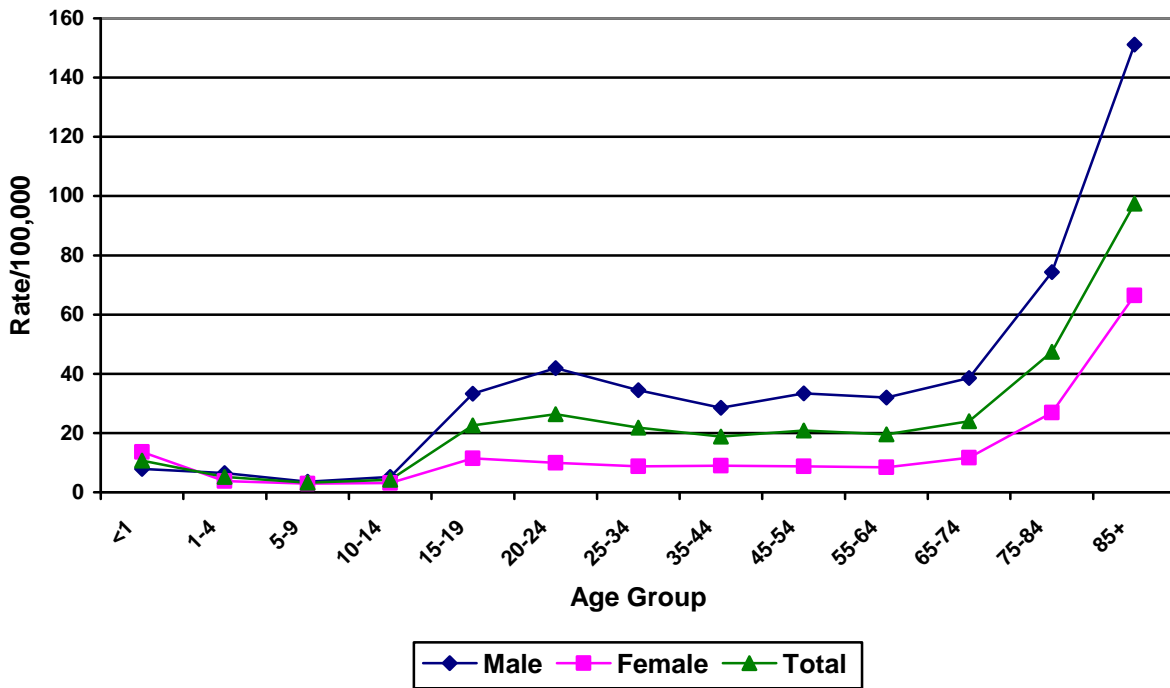

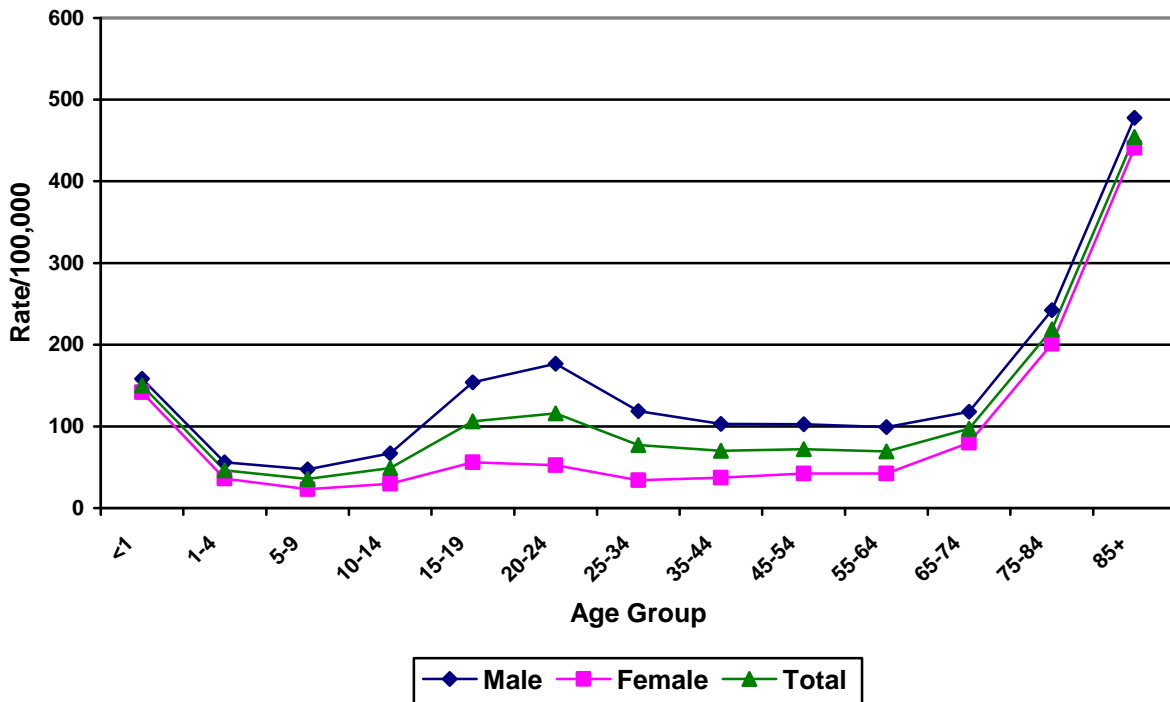

Figure 57. Age-Specific Traumatic Brain Injury Hospitalization Rates by Sex and Age Group

## **Hip Fractures, Ages 65 Years and Older**

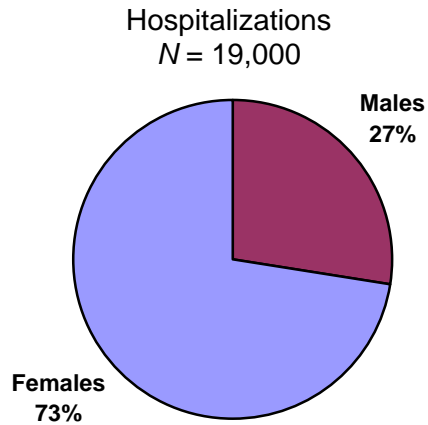

Hip fractures are a leading type of injury among Florida's older residents. Thirty-seven percent (37%) of all injury hospitalizations of residents aged 65 years and older in 2005 had a hip fracture diagnosis documented as a principal or secondary diagnosis. In 2005:

- There were 19,000 hospitalizations for injuries of Florida residents aged 65 years and older in which hip fracture was documented as a principal or secondary diagnosis.
- Females made up the majority (73%) of hip fracture hospitalizations while males made up 27%.
- Whites made up 86% of hip fracture hospitalizations, Blacks 3%, and Hispanics 2%.
- Hip fracture hospitalization rates increased dramatically for each five year age range with female's rates consistently higher than males.
- Falls were the leading mechanism of hip fractures resulting in hospitalizations. Seventy-eight percent (78%) of hip fractures were related to a fall. Nineteen percent (19%) of hip fracture hospitalizations did not indicate a mechanism of injury.

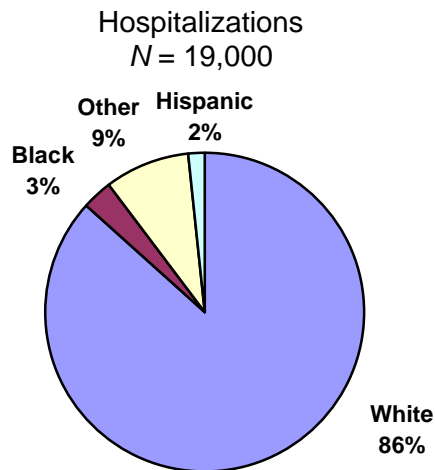

### **What is Florida Doing to Reduce Hip Fractures?**

- The Department of Elder Affairs and Communities for a Lifetime are working to provide seniors the opportunity to remain healthy and independent in their own communities. A focus is on increased safety through improved coordination of transportation, community planning, universal home designs, and neighborhood interaction.

## Appendix A: Data Sources and Case Definitions<sup>1,2,3</sup>

Two sources of data were used in this report, death certificate data and hospital discharge data. The attributes of each data source are briefly discussed below, and the case definitions for each injury are given for each data set.

### Death Certificate Data

Source:	Statewide death certificate data comes from the Florida Department of Health, Office of Vital Statistics, and are stored in centralized Microsoft SQL databases that are accessible to authorized users through a Data Source Name (DSN) connection using Microsoft SQL Query Analyzer, SAS, or SPSS statistical software packages.
Completeness:	Data is collected on all Florida resident deaths, as well as non-resident deaths that occurred in the state of Florida, making this a complete data source that allows for population-based surveillance of deaths from injury.
Timeliness:	Demographic information is entered into the death certificate database within two weeks of a person's death, and causes of death are added within 30 days after the demographic information is first entered, making this the timeliest data source in Florida's injury surveillance system. Causes of death are coded according to the International Classification of Diseases, 10 <sup>th</sup> Edition (ICD-10).
Data Quality: given	Provisional data are updated nightly until a final death data set for a calendar year is obtained and is not changed after a defined point in time. Year-by-year comparisons generally show comparable numbers of deaths by injury mechanism and intent across years, instilling reasonable confidence in the quality of the death data set, with the exception of motor vehicle crash deaths in the early 2000's, due to an automated coding error by the National Center for Health Statistics immediately after the transition from ICD-9 to ICD-10 cause of death coding in 1999.

## ICD-10 Case Definitions for Injury Deaths

External causes of death (injury mechanism and intent) are found in the underlying cause of death code field in the death certificate database. This field was searched for deaths of Florida residents in 2005 due to injuries according to the case definitions below. Deaths in which a traumatic brain injury (TBI) diagnosis was documented as a contributing cause of death were found by searching the twenty contributing cause of death code fields in the death certificate database for a TBI diagnosis code, according to the case definition for TBI below.

All Injuries	V01-X59	Accidents
	X60-X84	Intentional self-harm
	X85-Y09	Assault
	Y10-Y34	Event of undetermined intent
	Y35-Y36	Legal intervention and operations of war
	Y85-Y87, Y89	Sequelae of external causes of mortality
Unintentional Injuries	*U01-*U03	Terrorism
	V01-X59	Accidents
	Y85-Y86	Sequelae of external causes of morbidity and mortality
Suicides	X60-X84	Intentional self-harm
	Y87.0	Sequelae of intentional self-harm
	U03	Terrorism-intentional self-harm
Homicides	X85-Y09	Assault
	Y87.1	Sequelae of assault
	*U01, *U02	Terrorism-assault or sequelae of terrorism-assault
Unintentional Drownings	V90	Accident to watercraft causing drowning and submersion
	V92	Water-transport-related drowning and submersion without accident to watercraft
	W65-W74	Accidental drowning and submersion
Unintentional Falls	W00-W19	Accidental falls
Unintentional Fires	X00-X09	Exposure to smoke, fire and flames
Firearms	W32-W34	Accidental firearm discharge
	X72-X74	Intentional self-harm by firearm discharge
	X93-X95	Assault by firearm discharge
	Y22-Y24	Firearm discharge, undetermined intent
	Y35.0	Legal intervention involving firearm discharge
	*U01.4	Terrorism involving firearms
Motor Vehicle Accidents	V02-V04, V09.0	Pedestrian injured in transport accident
	V09.2	
	V12-V14, V19 (.0-.2,.4-.6)	Pedal cyclist injured in transport accident
	V20-V29	Motorcycle rider injured in transport accident

	V30-V39	Occupant of three-wheeled motor vehicle injured in transport accident
	V40-V49	Car occupant injured in transport accident
	V50-V59	Occupant of pick-up truck or van injured in transport accident
	V60-V69	Occupant of heavy transport vehicle injured in transport accident
	V70-V79	Bus occupant injured in transport accident
	V80 (.3-.5), V81.0, V81.1, V82.0, V82.1, V83-V86, V87 (.0-.8), V88.0-V88.8, V89.0, V89.2	Other land transport accidents
Poisonings	X40-X49	Accidental poisoning
	X60-X69	Intentional self-poisoning
	X85-X90	Assault by poisoning
	Y10-Y19	Poisoning, undetermined intent
	Y35.2	Legal intervention involving gas
	U01 (.6-.7)	Terrorism involving biological or chemical weapons
Traumatic Brain Injuries	S01.0-S01.9	Open wound of the head
	S02.0, S02.1, S02.3, S02.7- S02.9	Fracture of skull and facial bones
	S04.0	Injury to optic nerve and pathways
	S06.0-S06.9	Intracranial injury
	S07.0, S07.1, S07.8, S07.9	Crushing injury of head
	S09.7-S09.9	Other and unspecified injuries of head
	T01.0	Open wounds involving head with neck
	T02.0	Fractures involving head with neck
	T04.0	Crushing injuries involving head with neck
	T06.0	Injuries of brain and cranial nerves with injuries of nerves and spinal cord at neck level
	T90.1, T90.2, T90.4, T90.5, T90.8, T90.9	Sequelae of injuries of head

## Hospital Discharge Data

- Source:** Statewide hospital discharge data comes from the Florida Agency for Health Care Administration (AHCA), Florida Center for Health Information and Policy Analysis (formerly the State Center for Health Statistics), and is accessible on CD-ROM by submitting a Limited Data Set Data Use Agreement for data without patient identifiers.
- Completeness:** Data is collected on all hospital discharges from all non-federal acute care inpatient facilities licensed by AHCA to operate in Florida (exclusive of Veterans' Administration and other federal hospitals, rehabilitation centers, and psychiatric hospitals), making this a complete data source that allows for population-based surveillance of hospitalizations for injury. Included in this data set are readmissions, transfers, and deaths that occurred during hospitalization.
- Timeliness:** Data is accessible on a quarterly basis when 75% of licensed inpatient facilities have certified the accuracy of the data reported that quarter. The data is 100% certified usually within 180 days after the end of the quarter.
- Data Quality:** External causes of injury (mechanism and intent) are coded in hospital discharge data according to E-codes of the International Classification of Diseases, 9<sup>th</sup> Edition, Clinical Modification (ICD-9-CM). E-codes are necessary to determine the intent and mechanism of the injury that required the hospitalization. E-coding was required of hospitals by AHCA in 1997. Statewide E-coding rates of injury hospitalizations in the 9 secondary diagnosis code fields of the hospital discharge data set improved through 2001, but leveled off from 2002-2005. In 2006, the addition of 3 separate E-code fields in the hospital discharge data set dramatically improved the quality and completeness of E-coding of injury hospitalizations.

1997	1998	1999	2000	2001	2002	2003	2004	<b>2005</b>	2006
66.3%	70.7%	74.2%	75.7%	80.2%	86.6%	86.7%	85.7%	<b>85.2%</b>	94.7%

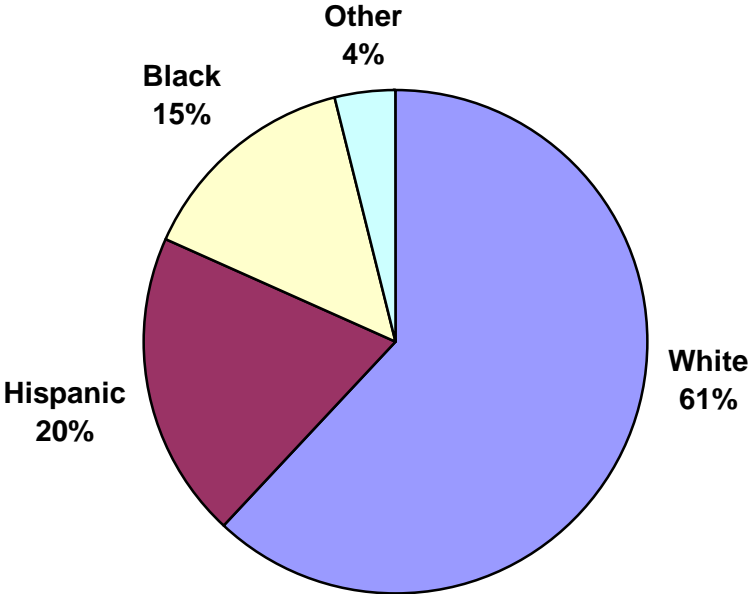

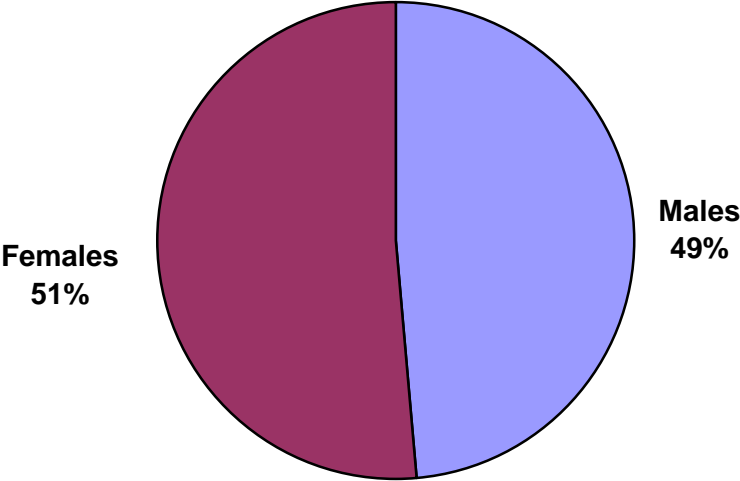

## ICD-9-CM Case Definitions for Injury Hospitalizations

ICD-9-CM N-codes indicating the physical nature of injury are found in the principal diagnosis code field of the hospital discharge data set. This field was searched for hospitalizations of Florida residents in 2005 due to injuries according to the case definition for all injuries below. The 9 secondary diagnosis code fields were then searched for E-codes indicating external causes of injury according to the case definitions below. Hospitalizations in which TBI or hip fracture was documented as a principal or secondary diagnosis were found by searching the principal and secondary diagnosis code fields for diagnosis N-codes according to the case definitions for TBI and hip fractures below.

All Injuries	800-909.2, 909.4, 909.9-994.9, 995.5-995.59, 995.80-995.85	Injury and poisoning
Unintentional Injuries	E800.0-E848.9, E850.0-E869.9, E880.0-E929.9	Unintentional injury and poisoning
Suicide Attempts	E950-E959	Suicide and self-inflicted poisoning and injury
Assaults	E960-E969	Assault, child and adult battering, and other maltreatment
Hip Fractures	820.0-820.9	Fracture of neck of femur
Near Drownings	994.1 E830 E832  E910 E954  E964 E984	Drowning and nonfatal submersion Accident to watercraft causing submersion Other accidental submersion or drowning in water transport accident Accidental drowning or submersion Suicide and self-inflicted injury by submersion (drowning) Assault by submersion (drowning) Submersion (drowning), undetermined whether accidentally or purposefully inflicted
Falls	E880-E886 E888 E957  E968.1 E987	Accidental fall Other and unspecified accidental fall Suicide and self-inflicted injuries by jumping from high place Assault by pushing from high place Falling from high place, undetermined whether accidentally or purposely inflicted
Fires	E890-E899	Accident caused by fire and flames
Firearms	E922.0-E922.3, E922.8, E922.9 E955.0-E955.4 E965.0-E965.4 E970 E985.0-E985.4	Accident caused by firearm and firearm missile  Suicide and self-inflicted injury by firearms Assault by firearms Injury due to legal intervention by firearms Injury by firearms, undetermined whether accidentally or purposely inflicted
Motor Vehicle Accidents	E810-E819, E820-E825 E810-E819 (.0,.1,.4,.5,.8,.9) E810-E819,	Motor vehicle accidents  Motor vehicle accident, injuring driver or passenger (occupant) of vehicle other than motorcycle Motor vehicle accident, injuring motorcyclist or

	E820-E825 (.2,.3)	passenger on motorcycle
	E810-E819	Motor vehicle accident, injuring pedal cyclist
	E820-E825 (.6)	
	E810-E819	Motor vehicle accident, injuring pedestrian
	E820-E825 (.7)	
Poisonings	E850-E858	Accidental poisoning by drugs, medicinal and biological substances
	E860-E869	Accidental poisoning by other solid and liquid substances, gases, and vapors
	E950-E952	Suicide and self-inflicted poisoning
	E962	Assault by poisoning
	E972	Injury due to legal intervention by gas
	E980-E982	Poisoning, undetermined whether accidentally or purposely inflicted
Traumatic Brain Injuries	800.0-801.9	Fracture of vault or base of skull
	803.0-804.9	Other and unqualified and multiple fractures of skull
	850.0-854.1	Intracranial injury, including concussion, contusion, laceration, and hemorrhage
	950.1-950.3	Injury to optic chiasm, optic pathways, and visual cortex
	959.01	Head injury, unspecified
	995.55	Shaken Infant Syndrome

# Appendix B: 2005 Florida Resident Demographics

Source: 2005 American Community Survey, U.S. Census Bureau.

## Appendix C: Calculation of Age-Adjusted Rates

All injury death and hospitalization rates in this report have been age-adjusted to the 2000 U.S. standard population. This allows rates to be compared between counties, and between counties and the state, that may have different underlying population age distributions that do not permit direct comparison of rates. By convention, the 2000 U.S. standard population is used as the standard population age distribution<sup>1</sup>.

To calculate an age-adjusted rate, the number of injury deaths or hospitalizations are divided into the following standard age groups: <1, 1-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, and 85+. The number of deaths or hospitalizations in each age group are then divided by the resident population estimate for that age group (shown in Appendix B), and multiplied by 100,000 to obtain the age-specific (crude) rate per 100,000 resident population for that age group. These age-specific rates are then weighted by multiplying by the appropriate population weight, according to the age distribution of the 2000 U.S. standard population. The individual weighted rates are then summed to obtain the age-adjusted (weighted) rate per 100,000 resident population. An example of calculating the age-adjusted unintentional injury death rate of 45.65 deaths per 100,000 Florida residents in 2005 is shown below:

Age Group	Number of Deaths	2005 Population Estimate	Age-Specific (Crude) Rate Per 100,000	2000 U.S. Standard Population	Population Weight	Age-Adjusted (Weighted) Rate Per 100,000
<1	102	224,356	45.4634599	3,795,000	0.01382	0.62830502
1-4	134	852,511	15.7182723	15,192,000	0.05532	0.86953482
5-14	140	2,275,772	6.15175861	39,977,000	0.14557	0.8955115
15-24	1188	2,334,592	50.8868359	38,077,000	0.13865	7.0554598
25-34	1111	2,176,924	51.035314	37,233,000	0.13557	6.91885753
35-44	1324	2,575,152	51.4144408	44,659,000	0.16261	8.36050222
45-54	1343	2,513,917	53.422607	37,030,000	0.13483	7.20297011
55-64	756	2,002,872	37.745797	23,961,000	0.08725	3.29332079
65-74	614	1,481,723	41.4382445	18,136,000	0.06604	2.73658167
75-84	1026	1,162,886	88.2287688	12,315,000	0.04484	3.95617799
85+	1005	417,792	240.550322	4,259,000	0.01551	3.73093549
<b>Total</b>	<b>8743</b>	<b>18018497</b>	<b>48.5223601</b>	<b>274,634,000</b>		<b>45.65</b>

As described above, age-specific rates are calculated as an intermediate step in the calculation of age-adjusted rates. Age-specific injury death and hospitalization rates are shown in this report only for state-level data and not for county-level data. However, age-specific rates for a particular county can be calculated as described above, using the data included in this report on injury deaths and hospitalizations broken out by age group for residents in each of Florida's 67 counties and the resident population estimates.

## Florida's Rural Counties: A Statistical Paradox

Thirty-three of Florida's 67 counties meet the statutory definition of "rural" as a geographic area with a population density of less than 100 individuals per square mile, as defined by Florida Statute 381.0406(2)(a). Portions of other counties may also be defined as rural by the U.S. Census Bureau. These 33 counties include the following:

Baker	Franklin	Hardee	Lafayette	Okeechobee	Wakulla
Bradford	Gadsden	Hendry	Levy	Putnam	Walton
Calhoun	Gilchrist	Highlands	Liberty	Sumter	Washington
Columbia	Glades	Holmes	Madison	Suwannee	
DeSoto	Gulf	Jackson	Monroe	Taylor	
Dixie	Hamilton	Jefferson	Nassau	Union	

It appears at first glance that many of these counties had some of the highest age-adjusted injury death and hospitalization rates in the state in 2005. However, a closer look reveals that many of these rates were based on very small numbers of deaths and hospitalizations, making these rates statistically unstable.

Thus, a statistical paradox exists in which the high rates of injury deaths and hospitalizations seen in rural county residents are often based on very small numbers of deaths and hospitalizations. Caution should be taken when interpreting and using all rates based on small numbers. This applies to both rural and non-rural counties.

An exception to this paradox is the high rates of motor vehicle traffic deaths and hospitalizations seen in rural county residents, which are based on numbers of deaths and hospitalizations due to this injury mechanism that are not insignificant. Evidence from other states, especially in the Southeast, suggests that this is a very real problem in rural areas, and supports the high motor vehicle traffic death and hospitalization rates observed in this report among residents of rural counties in Florida in 2005<sup>1,2</sup>. Lack of seat belt use among rural motorists, hazardous conditions of rural roads, and delayed access to emergency medical care, have been suggested as some possible reasons for the high traffic mortality observed in rural areas, that present multiple challenges to traffic safety in these areas<sup>1,2</sup>.
